

Effects and animation.

Part 1.

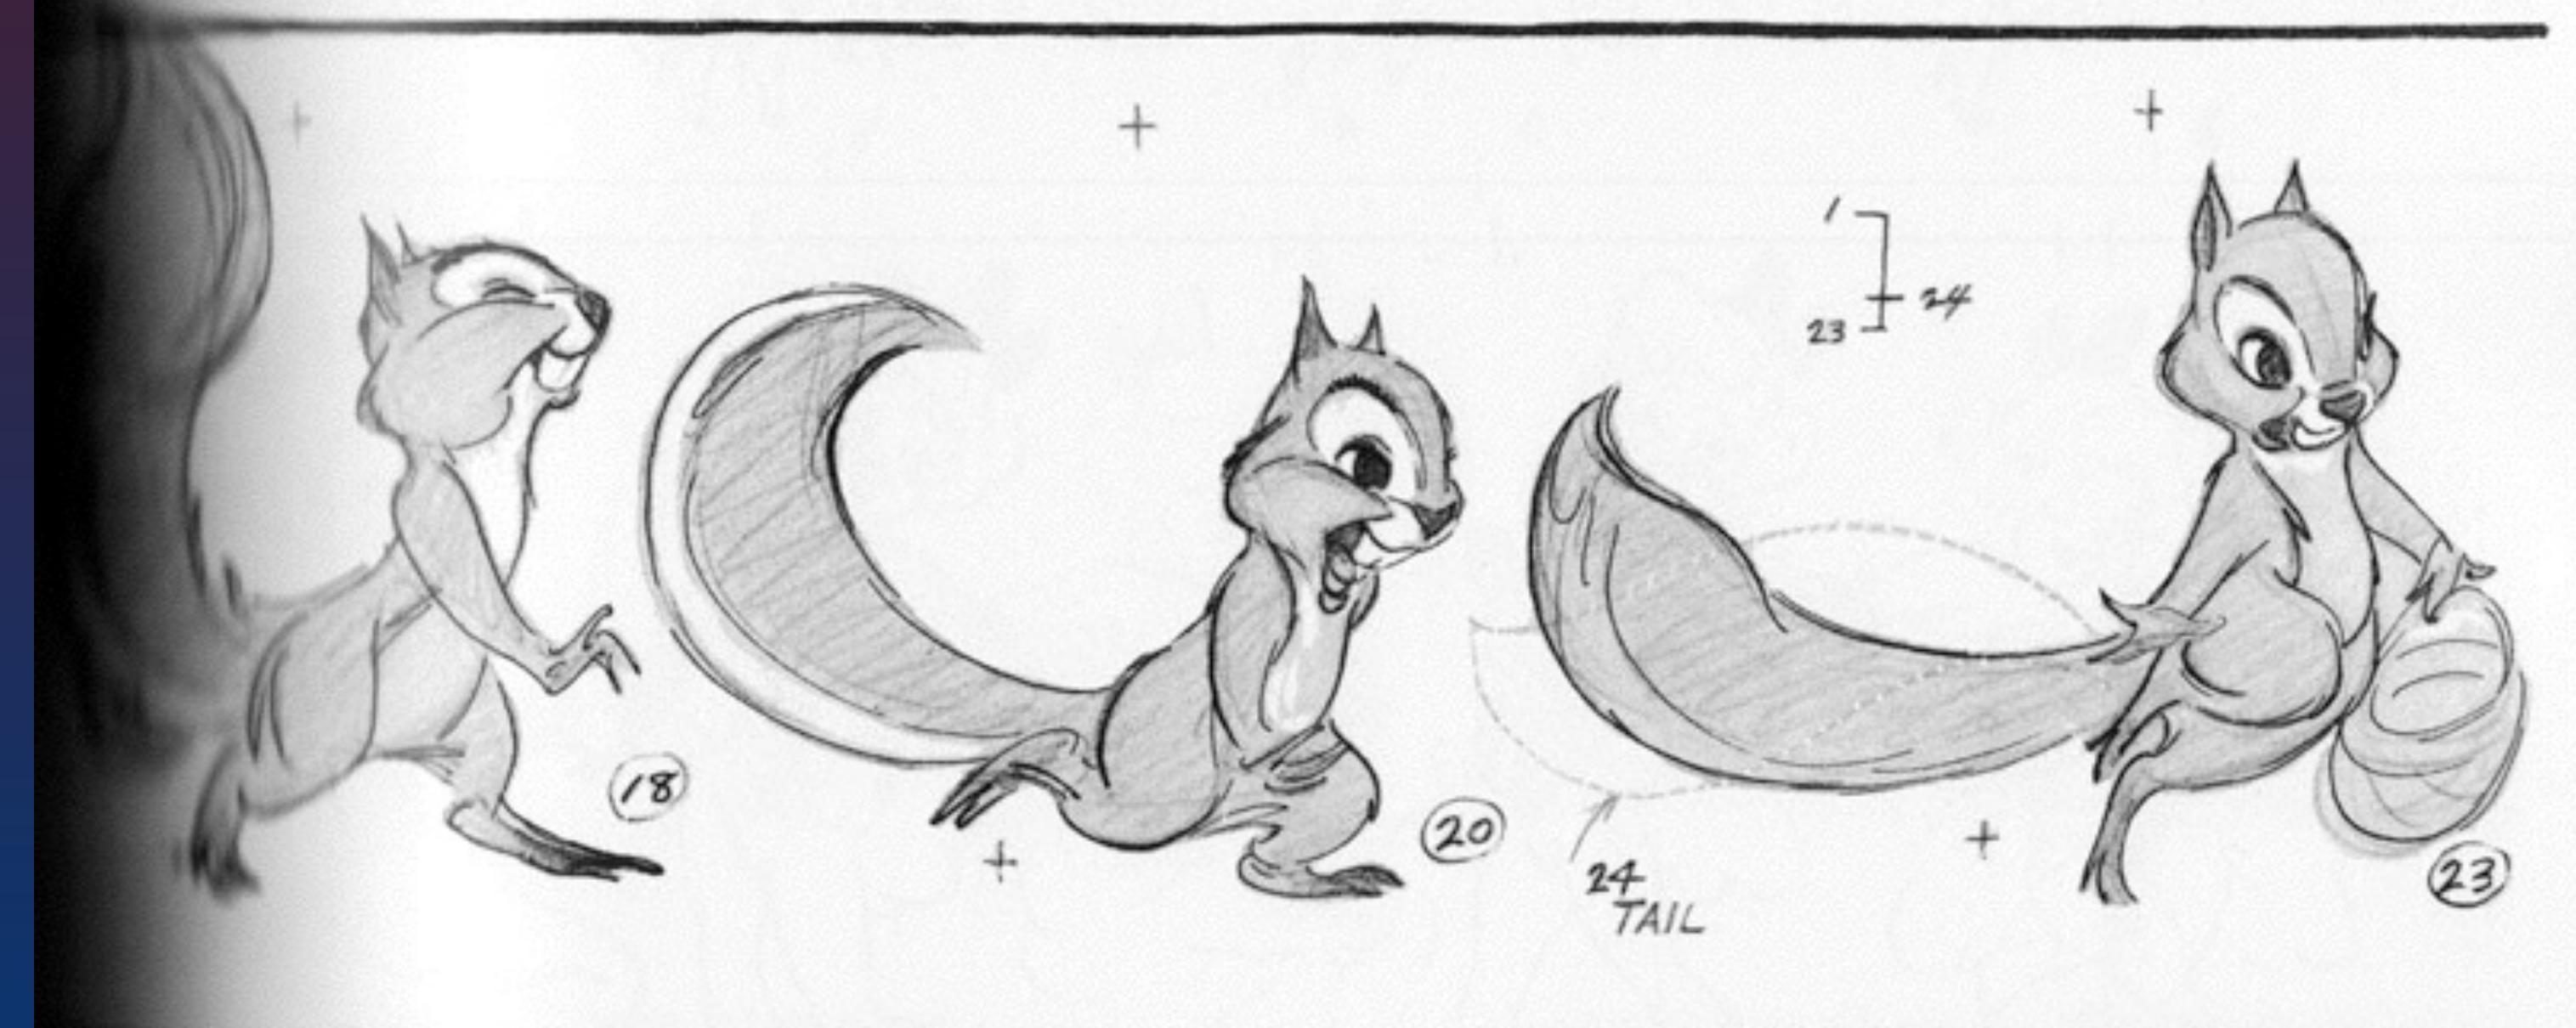

Mapping value ranges.

```
float mapValue(float value, float srcMin, float srcMax, float dstMin, float dstMax) {  
    float retVal = dstMin + ((value - srcMin)/(srcMax-srcMin) * (dstMax-dstMin));  
    if(retVal < dstMin) {  
        retVal = dstMin;  
    }  
    if(retVal > dstMax) {  
        retVal = dstMax;  
    }  
    return retVal;  
}
```

Tweening.

In-be-tweening.

0.0

1.0

Linear interpolation.

```
float lerp(float from, float to, float time) {  
    return (1.0-time)*from + time*to;  
}
```

```
float lerp(float v0, float v1, float t) {
    return (1.0-t)*v0 + t*v1;
}

void update() {
    animationTime = animationTime + elapsed;
    float animationValue = mapValue(animationTime, animationStart,
animationEnd, 0.0, 1.0);
    DrawCircle(lerp(0.0, 1.0, animationValue), 0.0);
}
```

0.0

1.0

Easing in.

```
float easeIn(float from, float to, float time) {  
    float tVal = time*time*time*time*time;  
    return (1.0f-tVal)*from + tVal*to;  
}
```

0.0

1.0

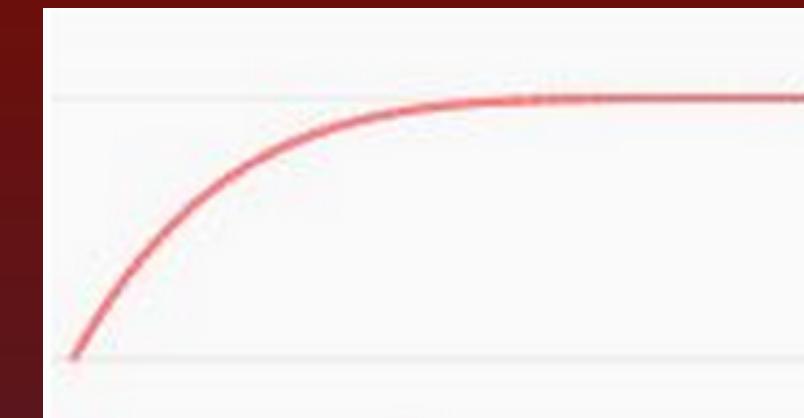

Easing out.

```
float easeOut(float from, float to, float time) {  
    float oneMinusT = 1.0f-time;  
    float tVal = 1.0f - (oneMinusT * oneMinusT * oneMinusT *  
oneMinusT * oneMinusT);  
    return (1.0f-tVal)*from + tVal*to;  
}
```

0.0

1.0

Easing in and out.

```
float easeInOut(float from, float to, float time) {
    float tVal;
    if(time > 0.5) {
        float oneMinusT = 1.0f - ((0.5f-time)*-2.0f);
        tVal = 1.0f - ((oneMinusT * oneMinusT * oneMinusT * oneMinusT) * 0.5f);
    } else {
        time *= 2.0;
        tVal = (time*time*time*time)/2.0;
    }
    return (1.0f-tVal)*from + tVal*to;
}
```

0.0

1.0

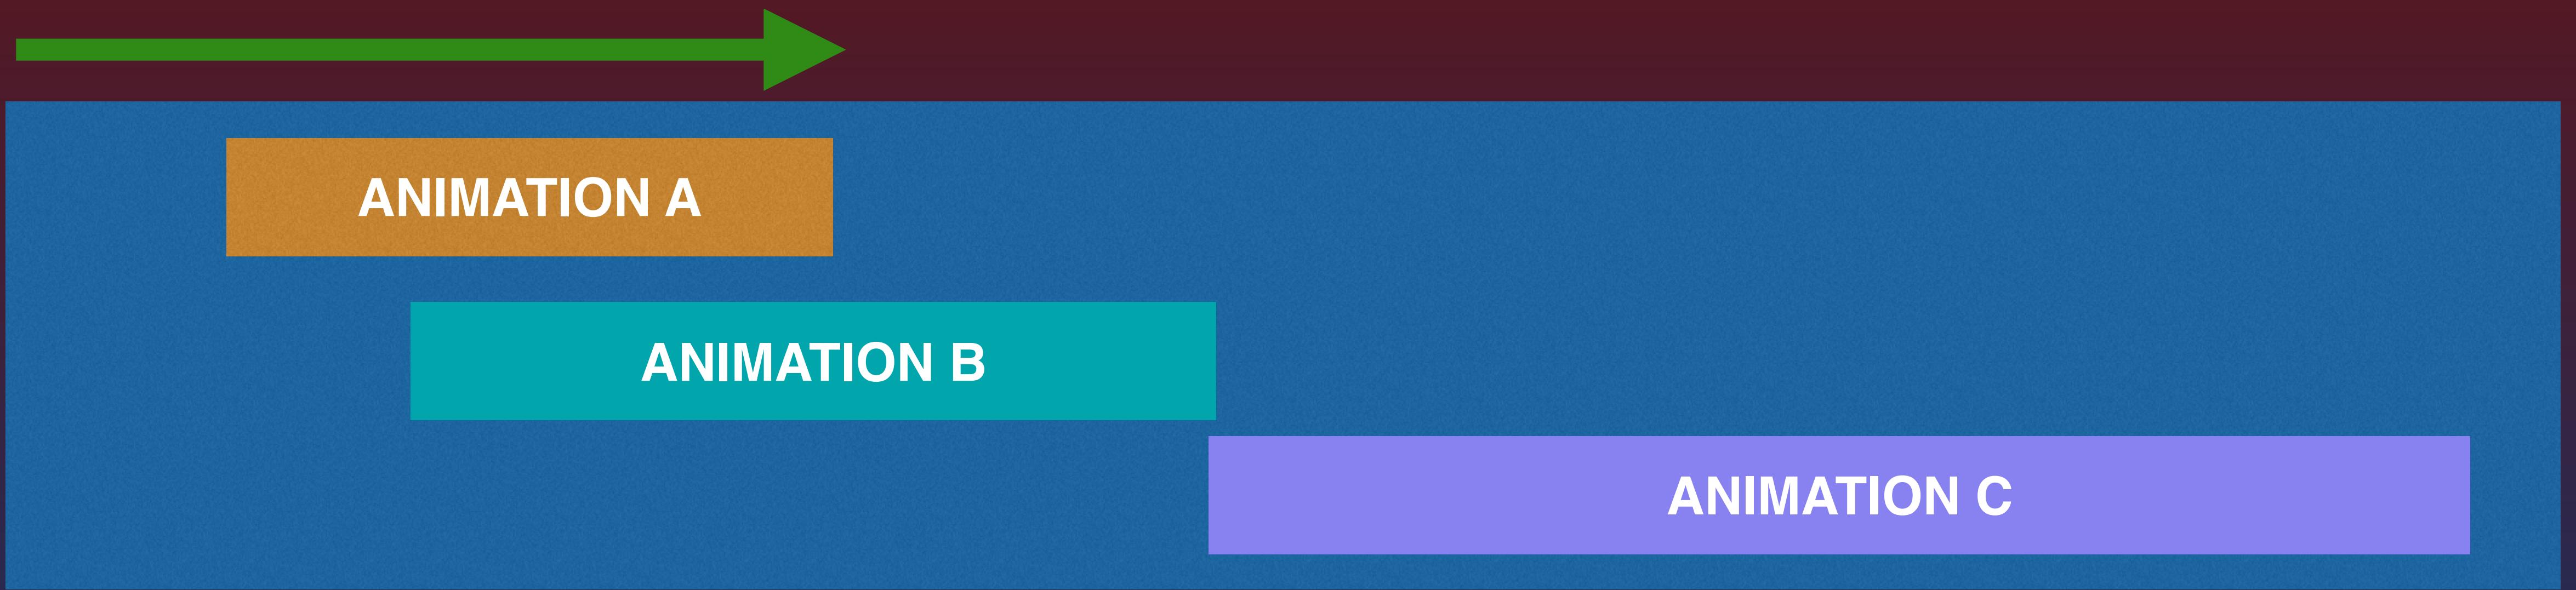

Overshooting our target.

```
float easeOutElastic(float from, float to, float time) {
    float p = 0.3f;
    float s = p/4.0f;
    float diff = (to - from);
    return from + diff + (diff*pow(2.0f,-10.0f*time) * sin((time-s)*(2*PI)/p));
}
```

Mapping animations to time.

Time elapsed

1.0

2.0

3.0

4.0

5.0

6.0

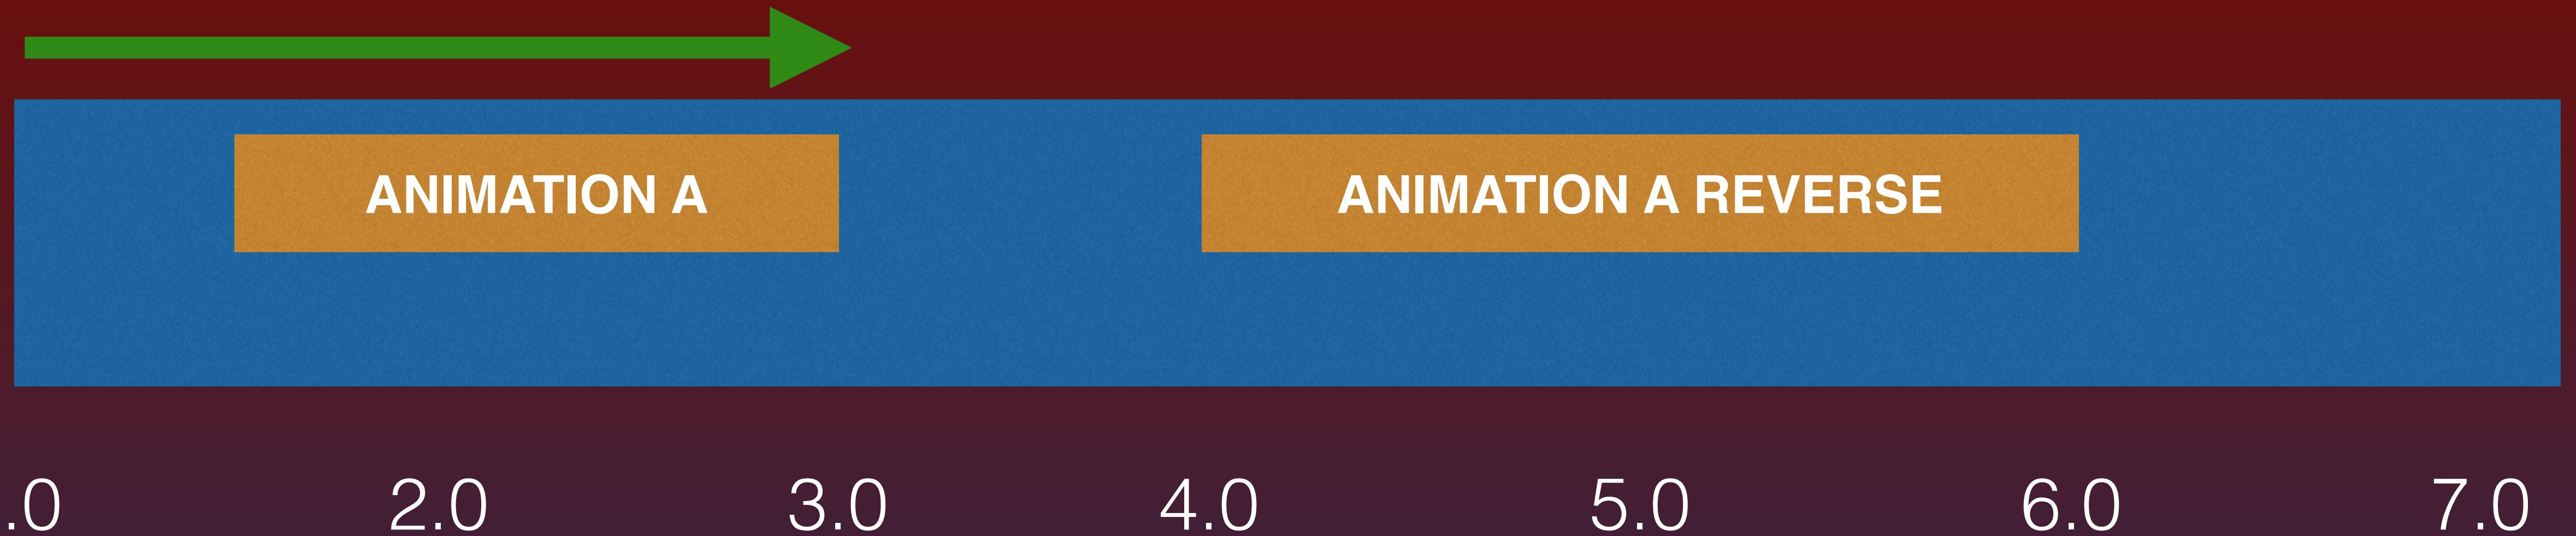

7.0

Time elapsed

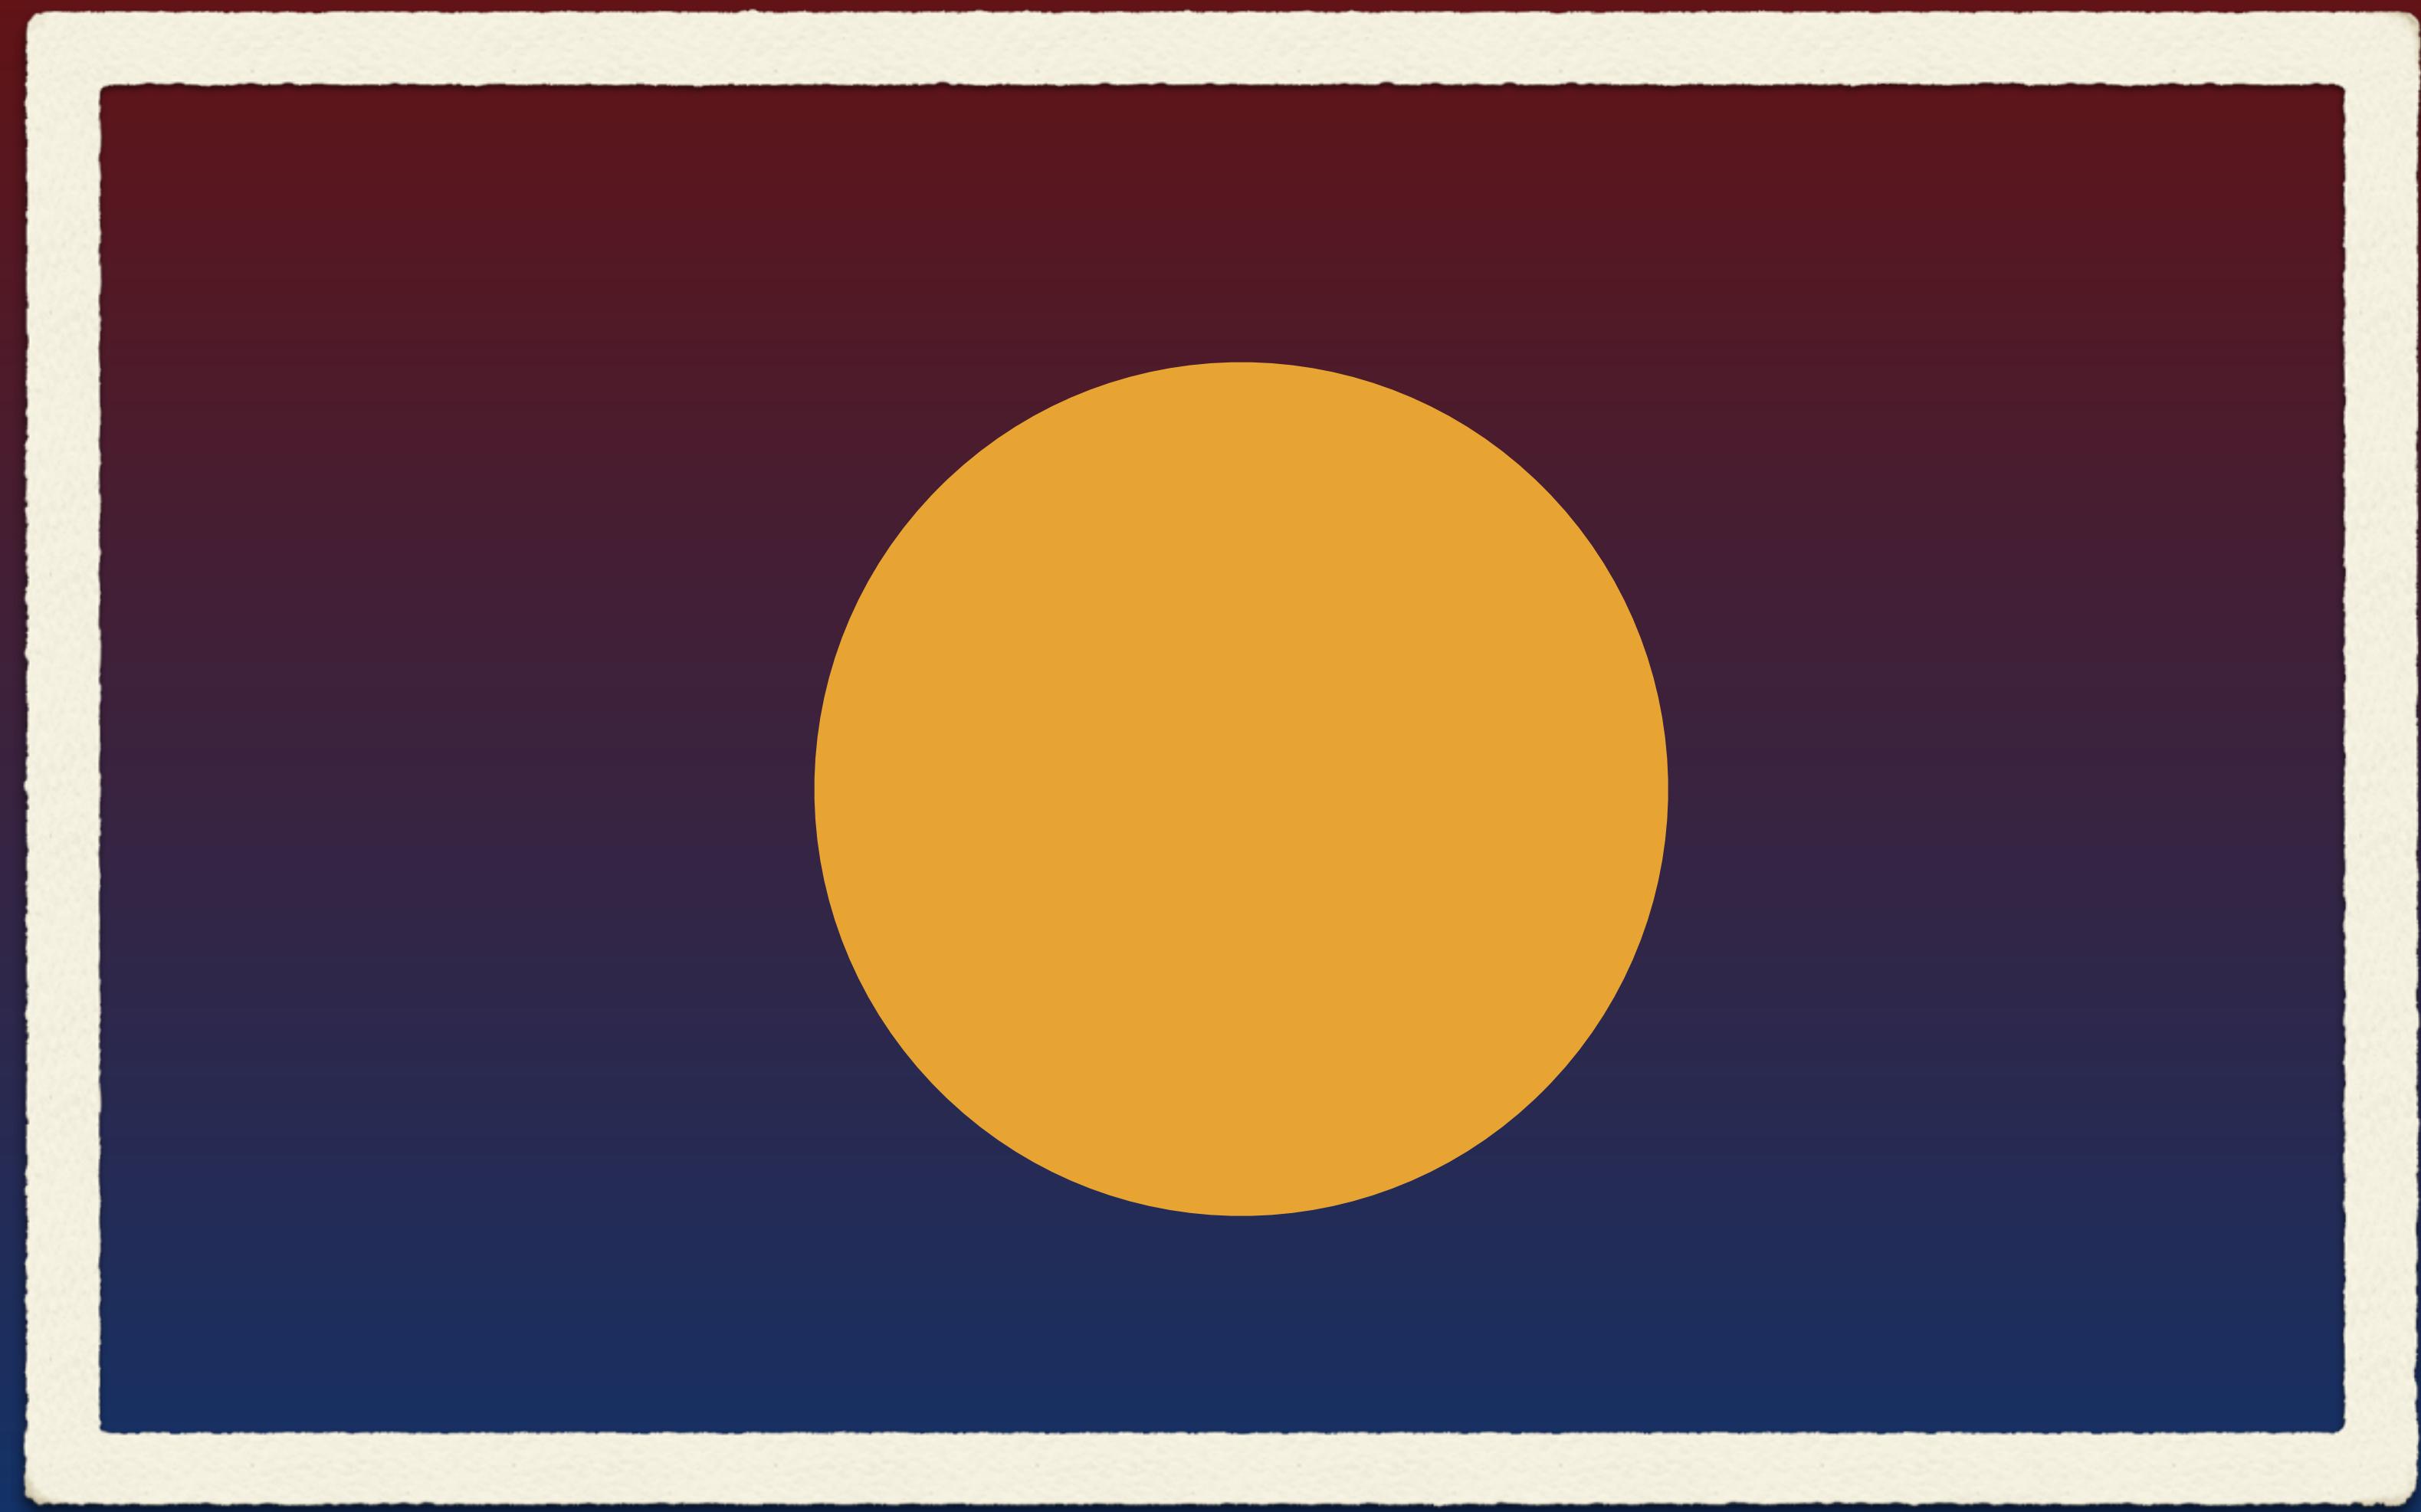

```
float animationAValue = mapValue(timeElapsed, 1.5f, 3.0f, 0.0f, 1.0f);
float animationBValue = mapValue(timeElapsed, 2.0f, 4.0f, 0.0f, 1.0f);
float animationCValue = mapValue(timeElapsed, 4.0f, 7.0f, 0.0f, 1.0f);
```

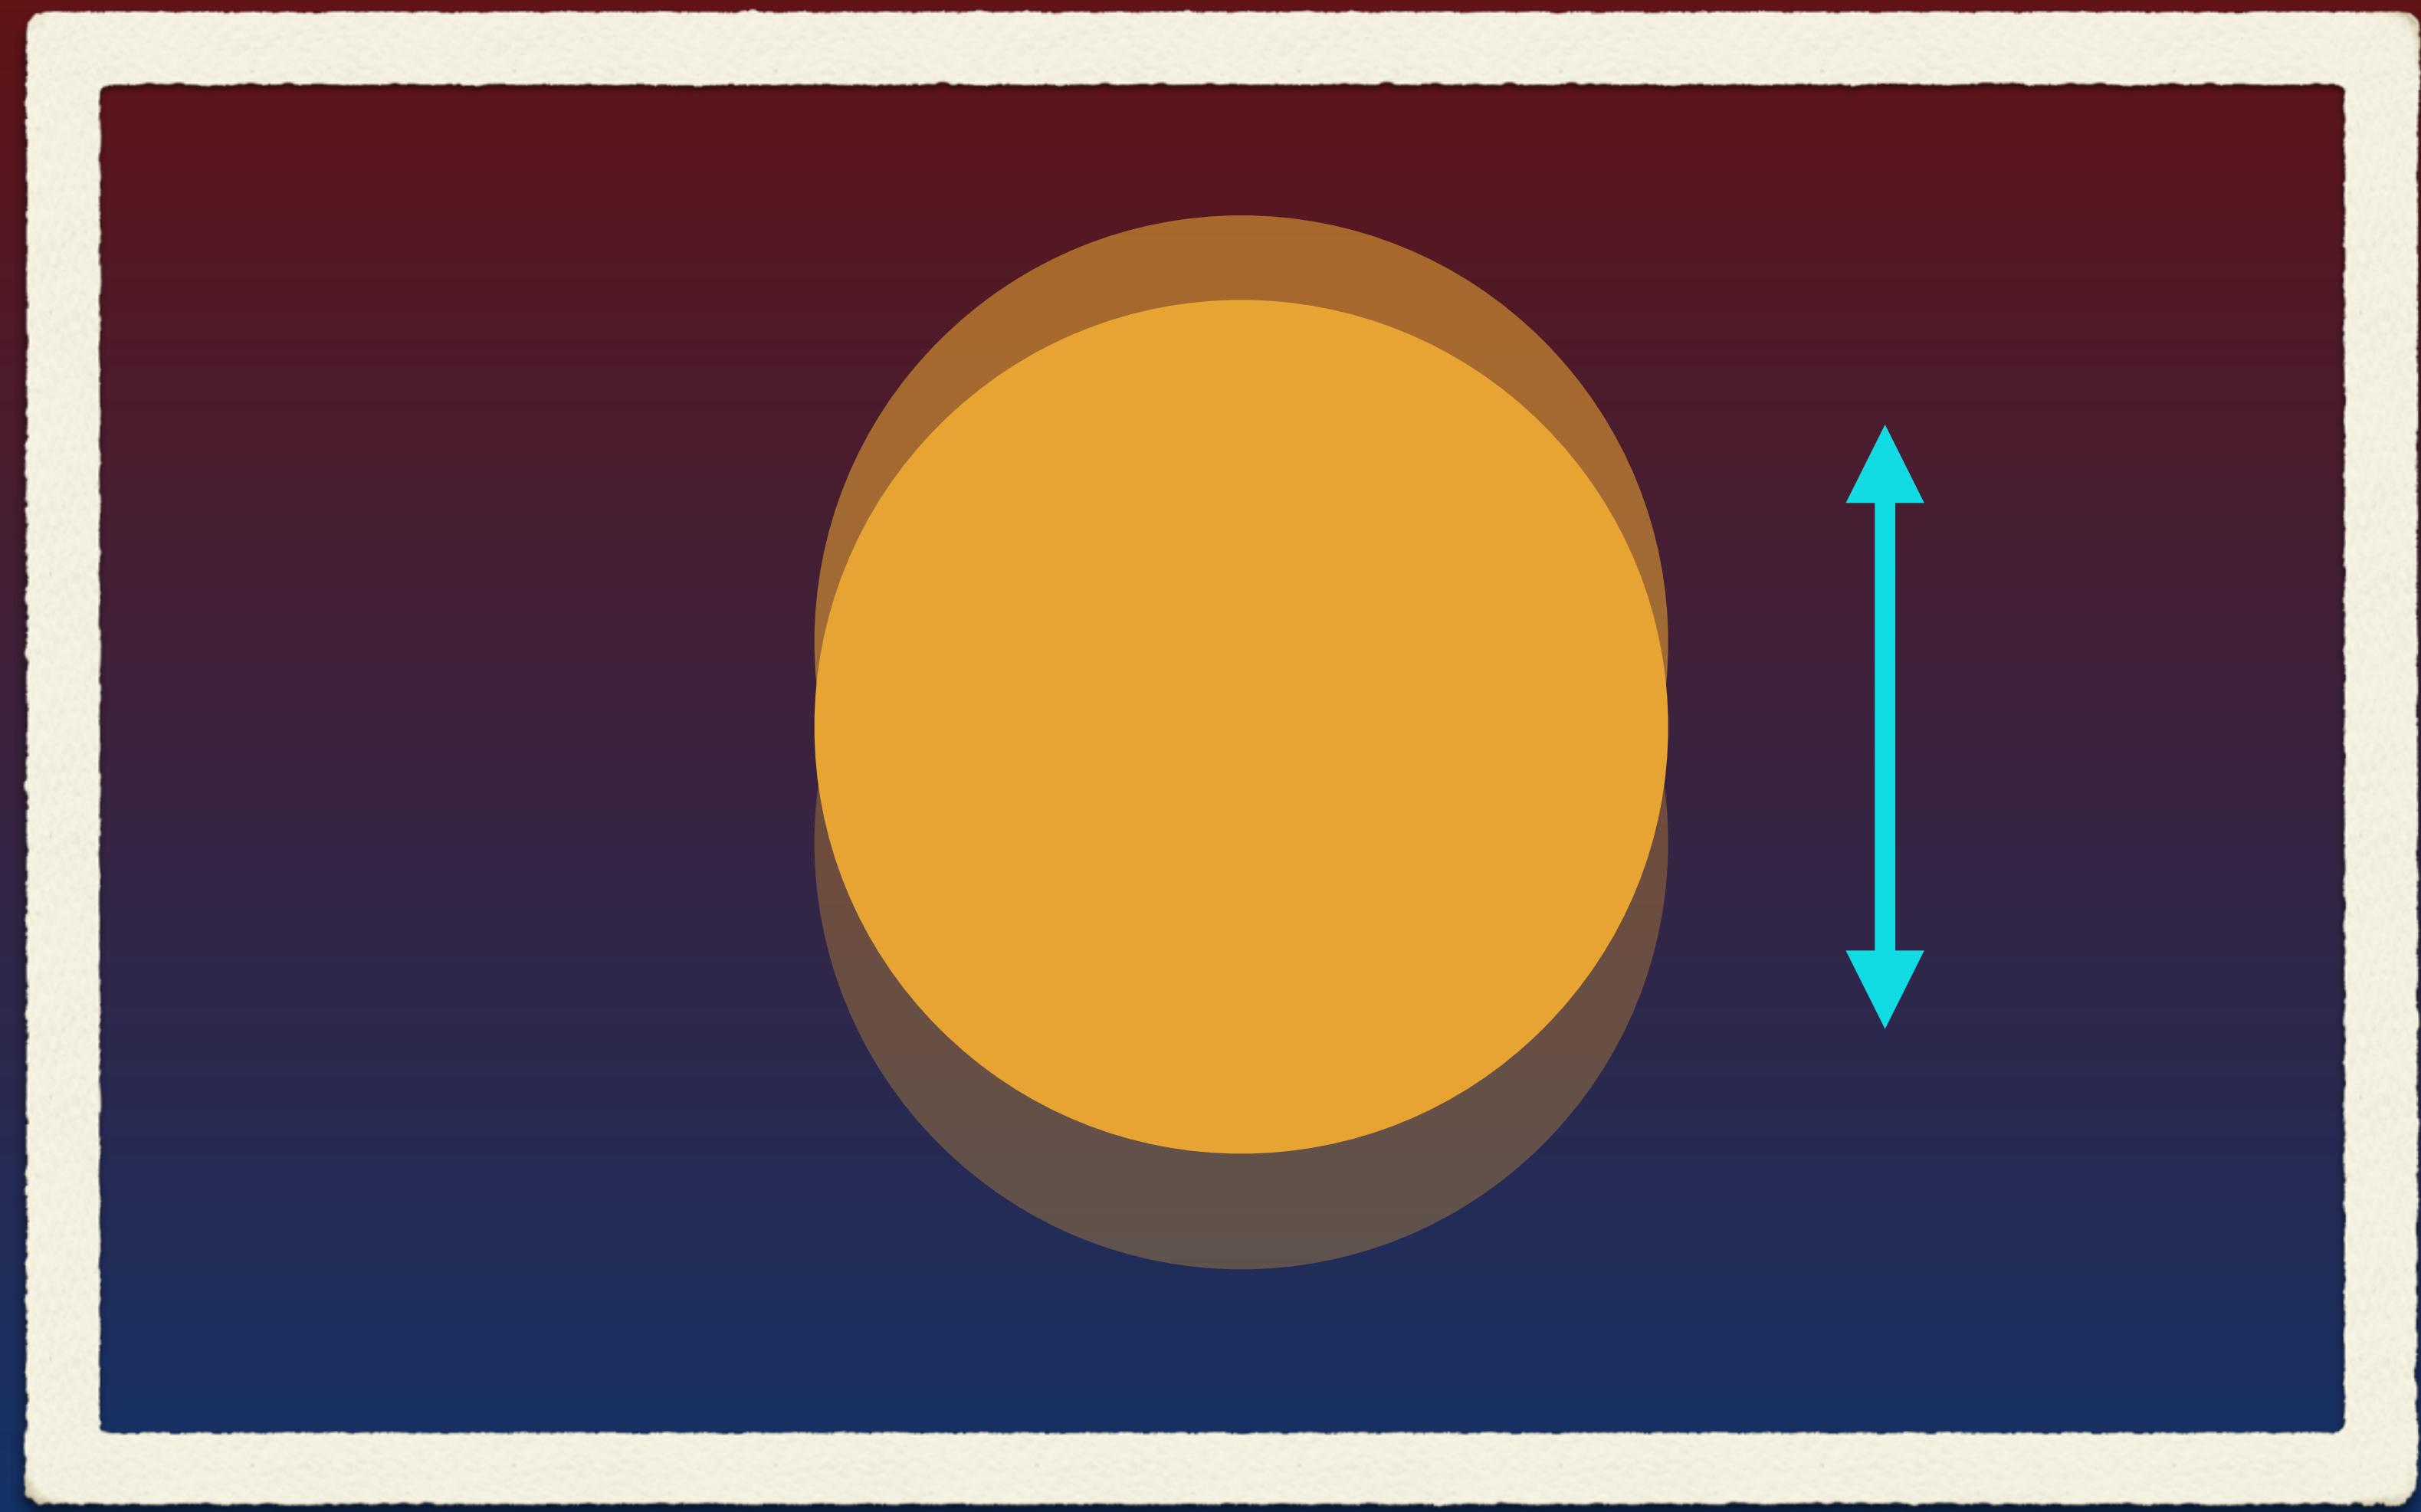

Time elapsed

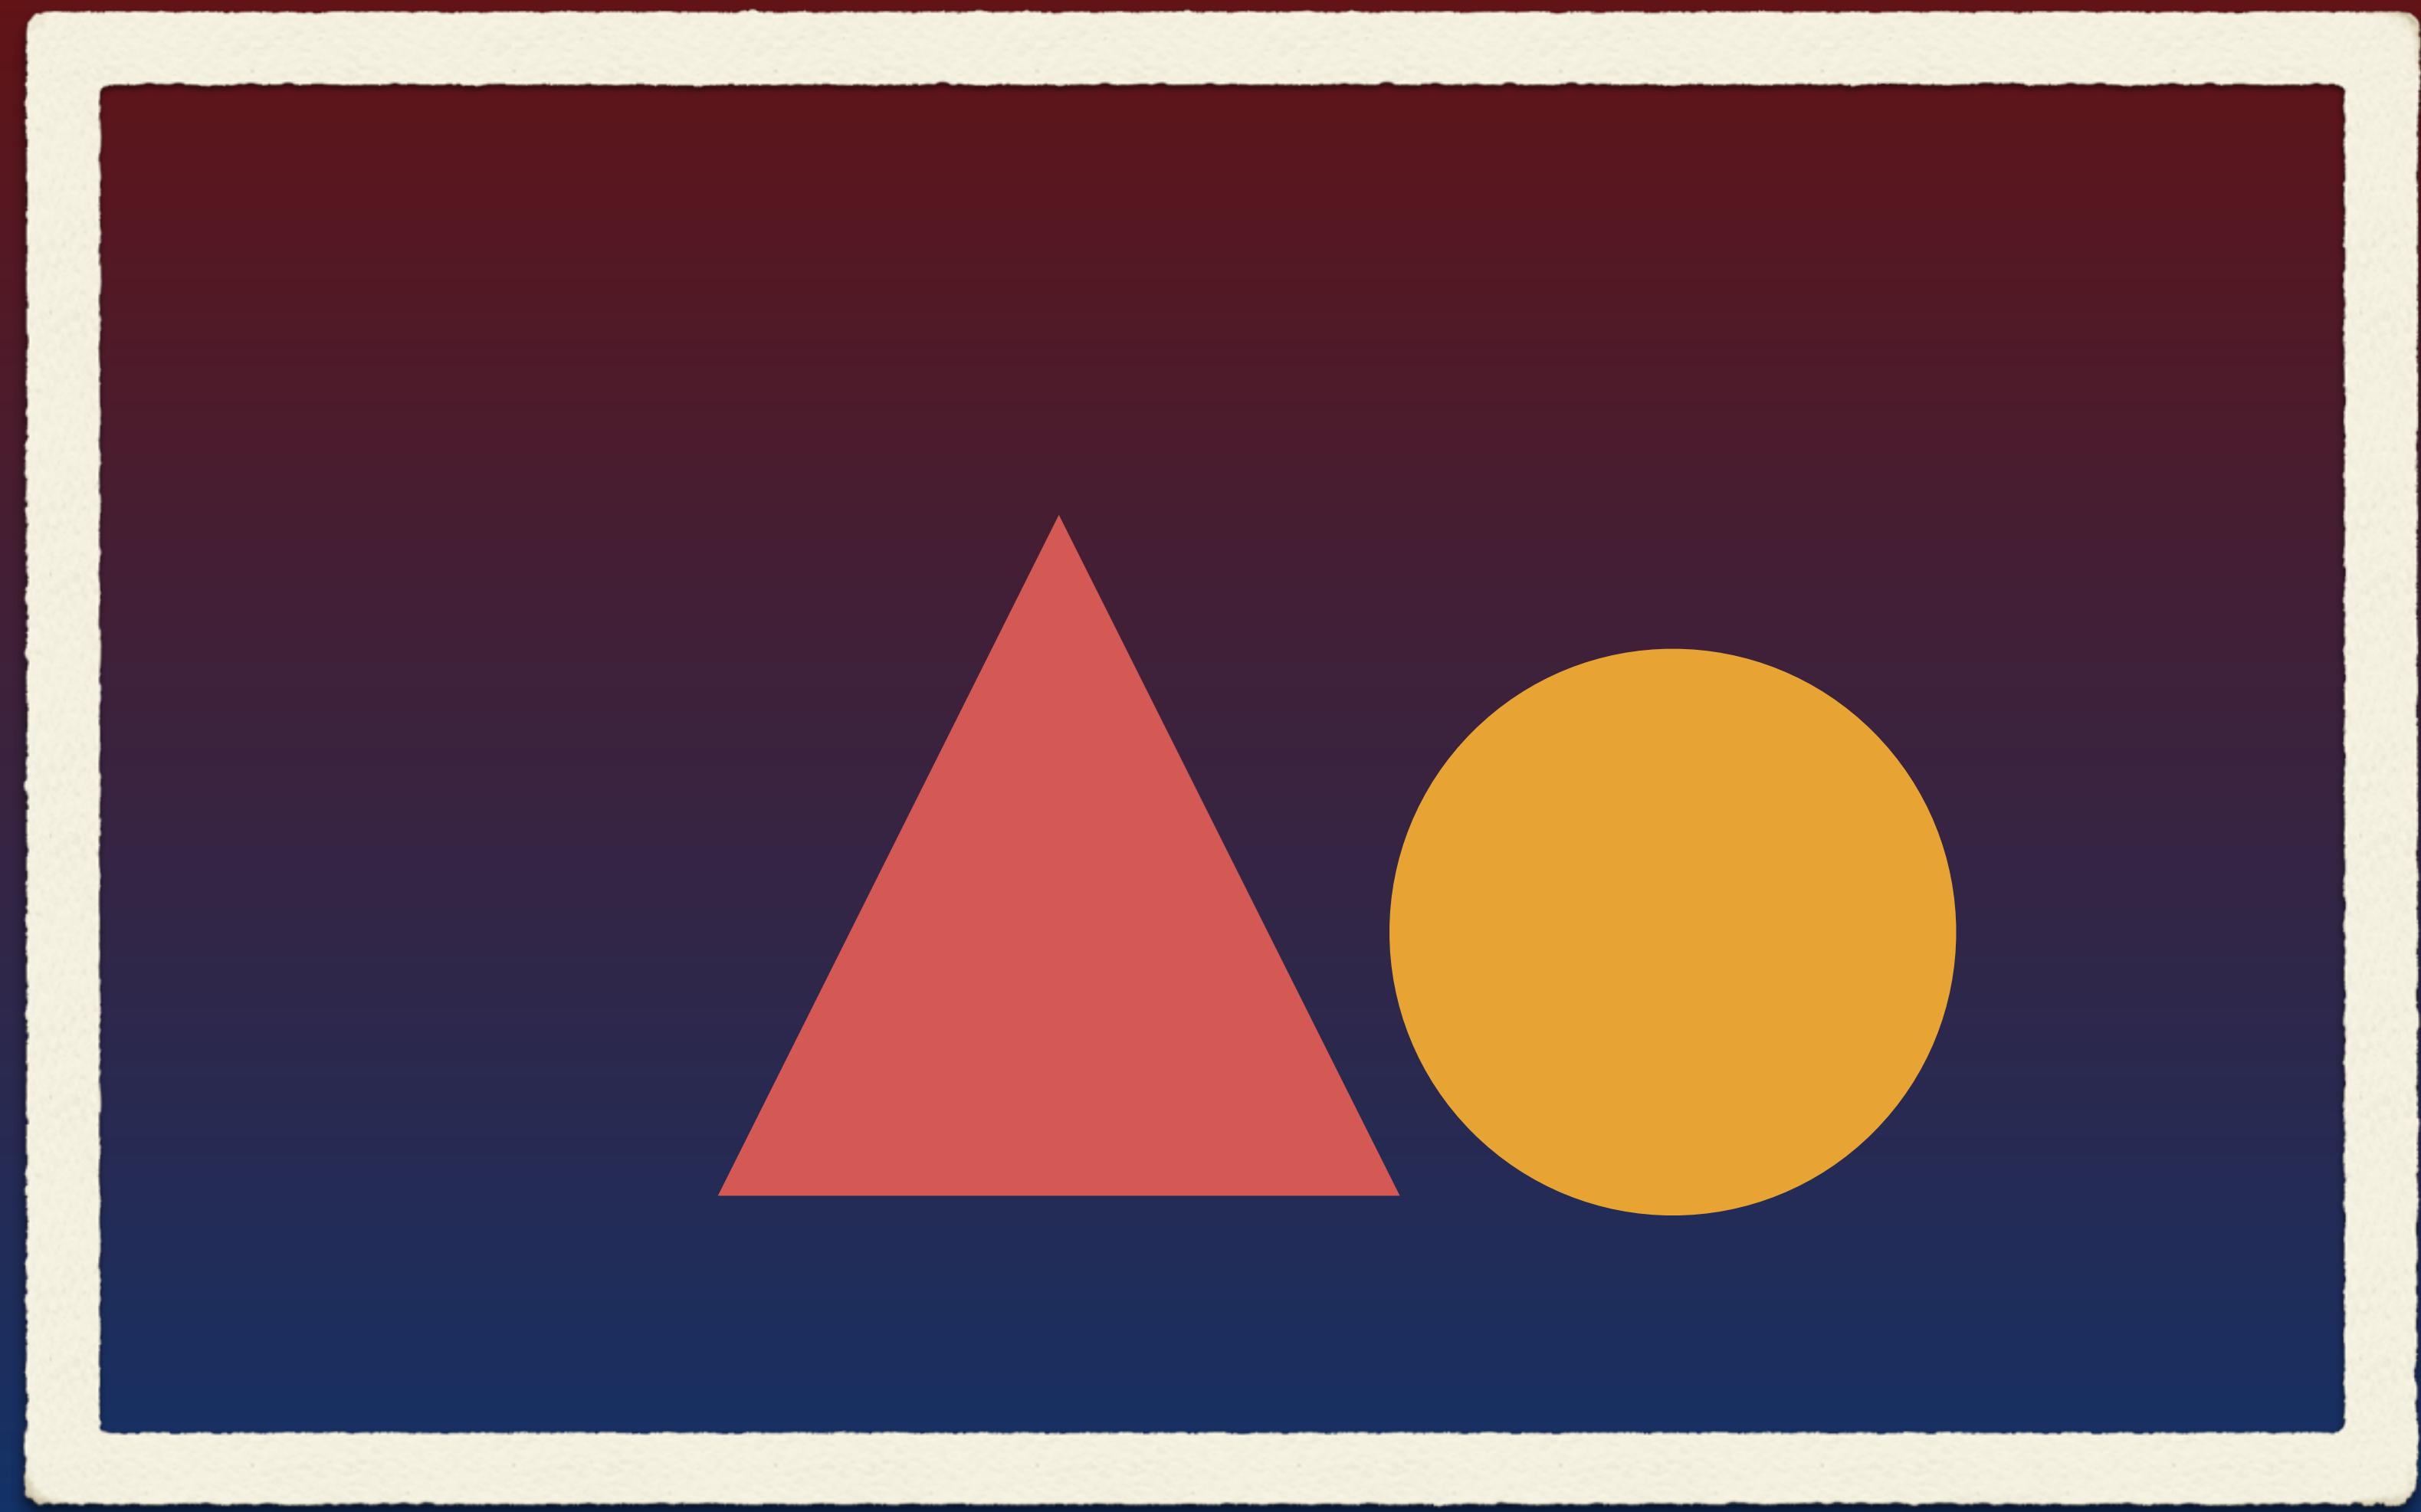

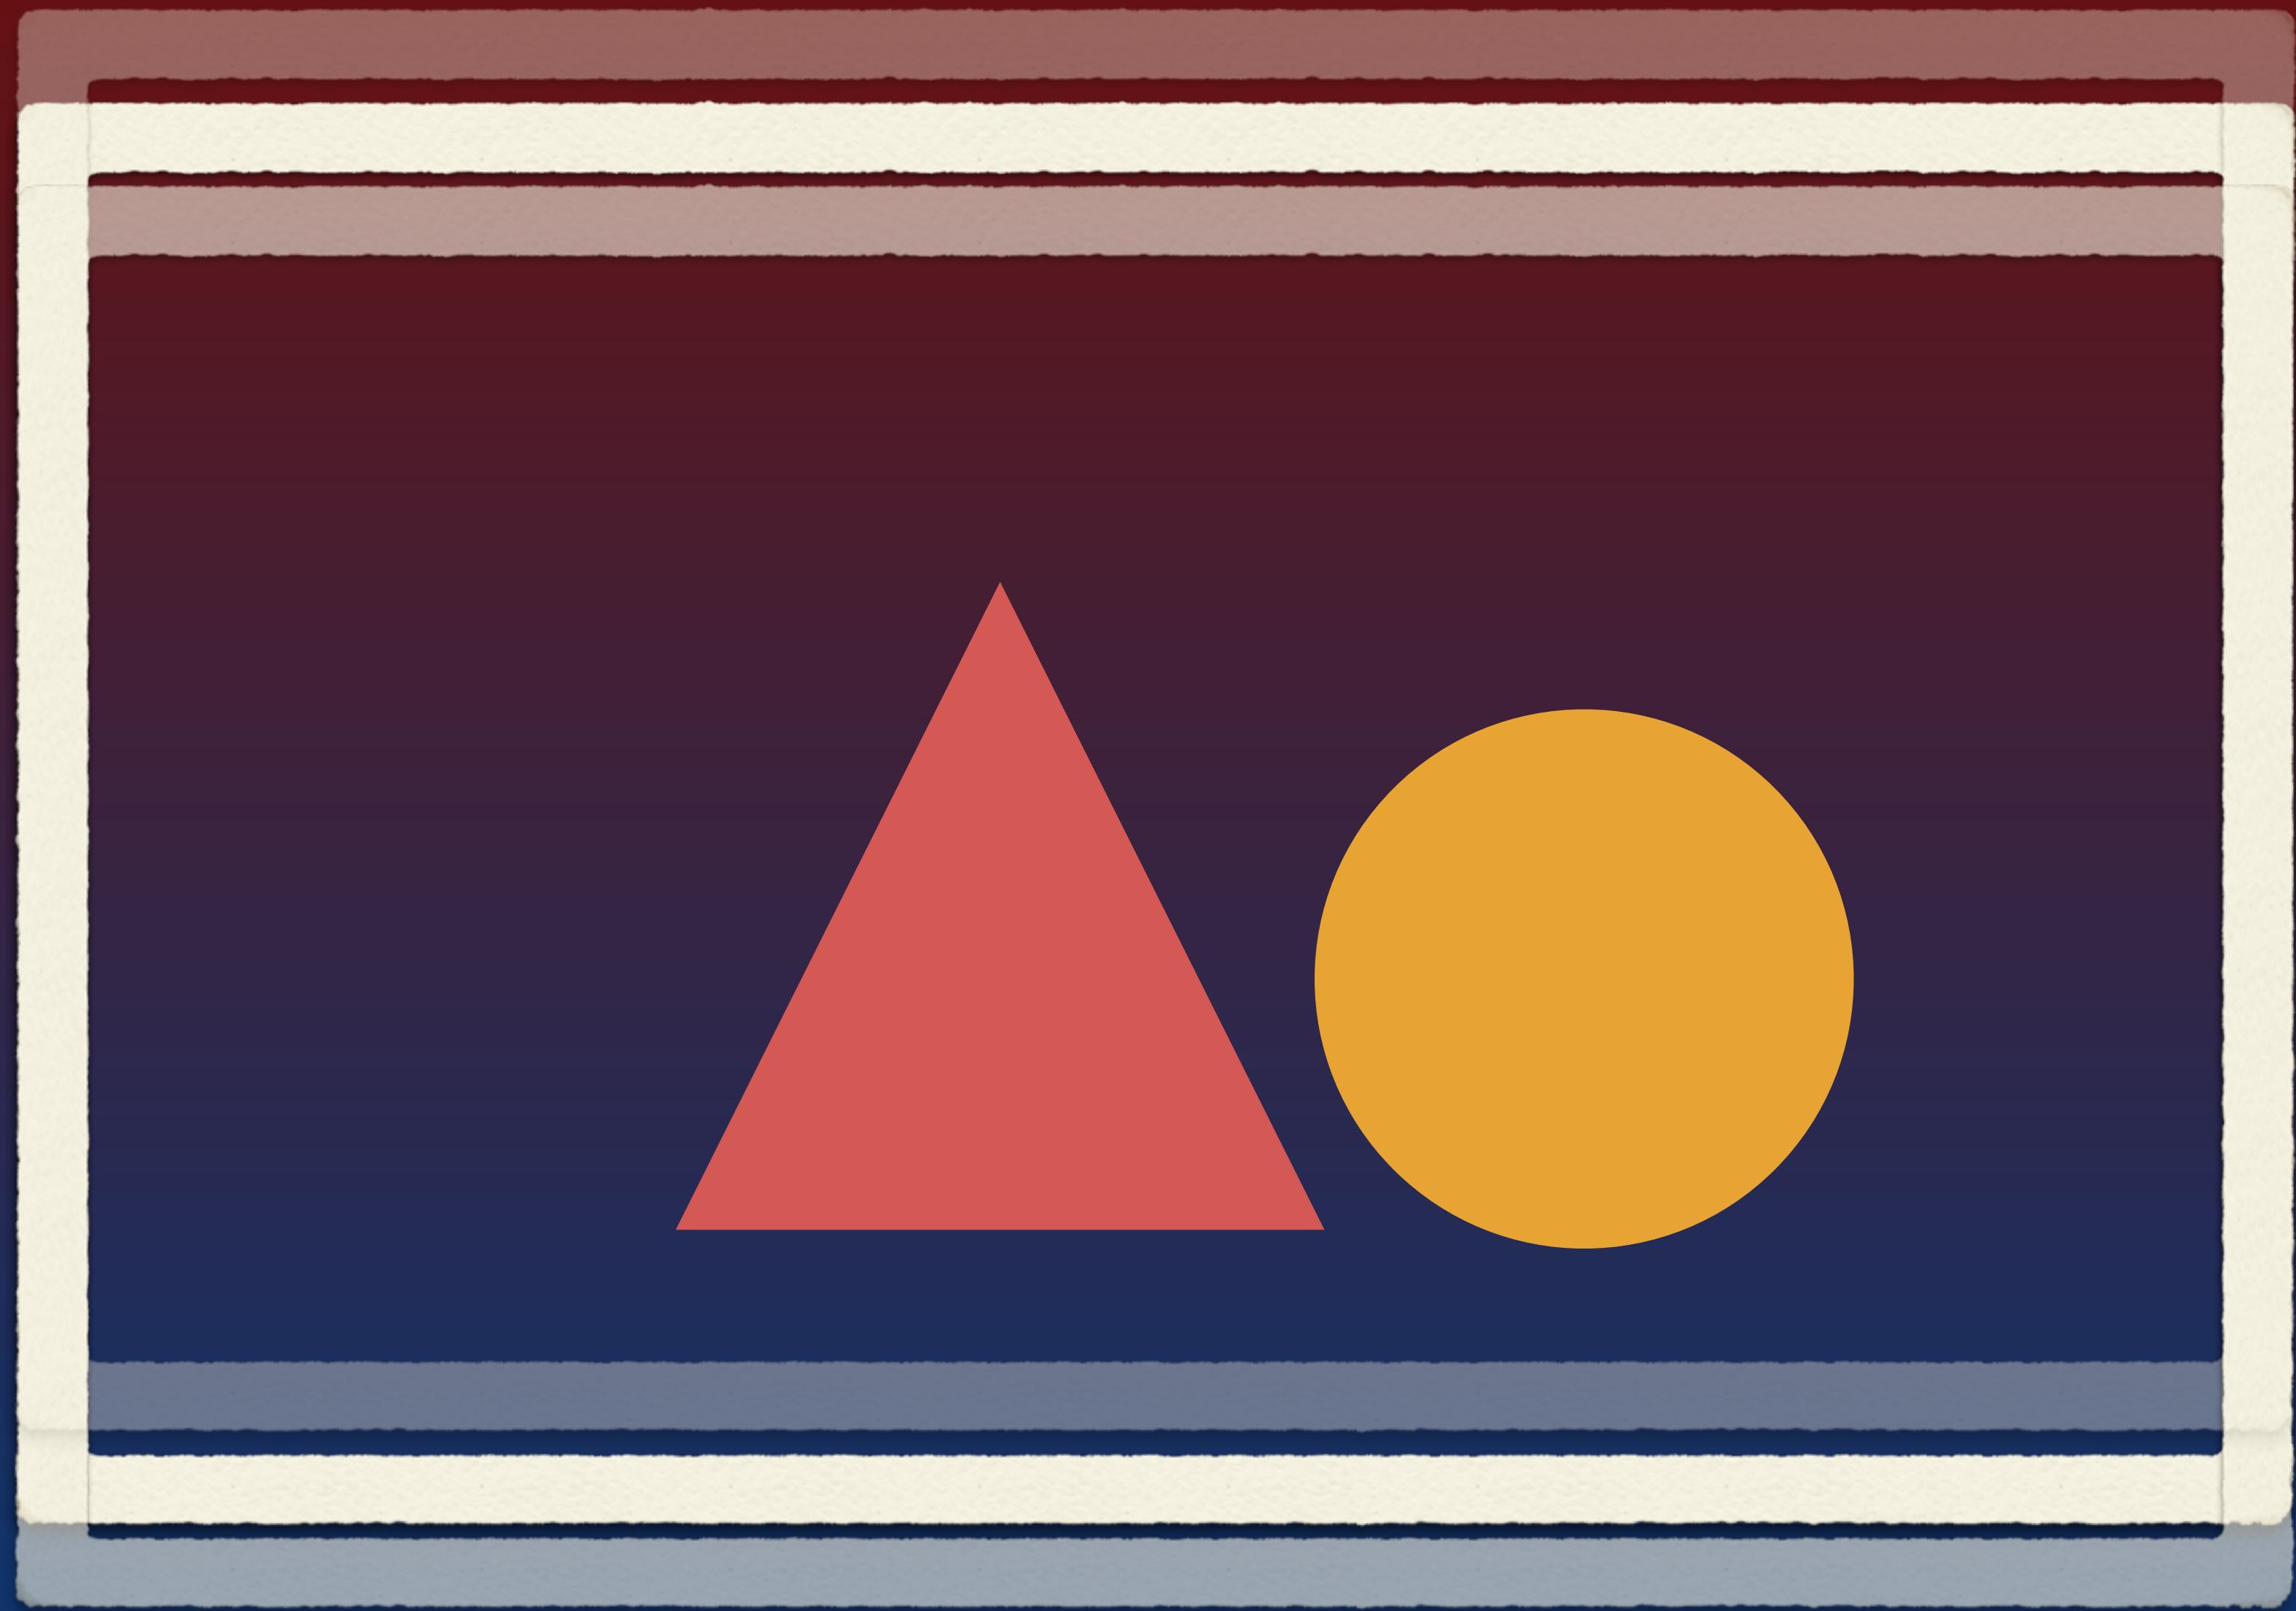

```
float animationAValue;  
if(timeElapsed > 4.0) {  
    animationValue = mapValue(stageAnimationTime, 6.0, 4.0, 0.0, 1.0);  
} else {  
    animationValue = mapValue(stageAnimationTime, 1.5, 3.0, 0.0, 1.0);  
}
```

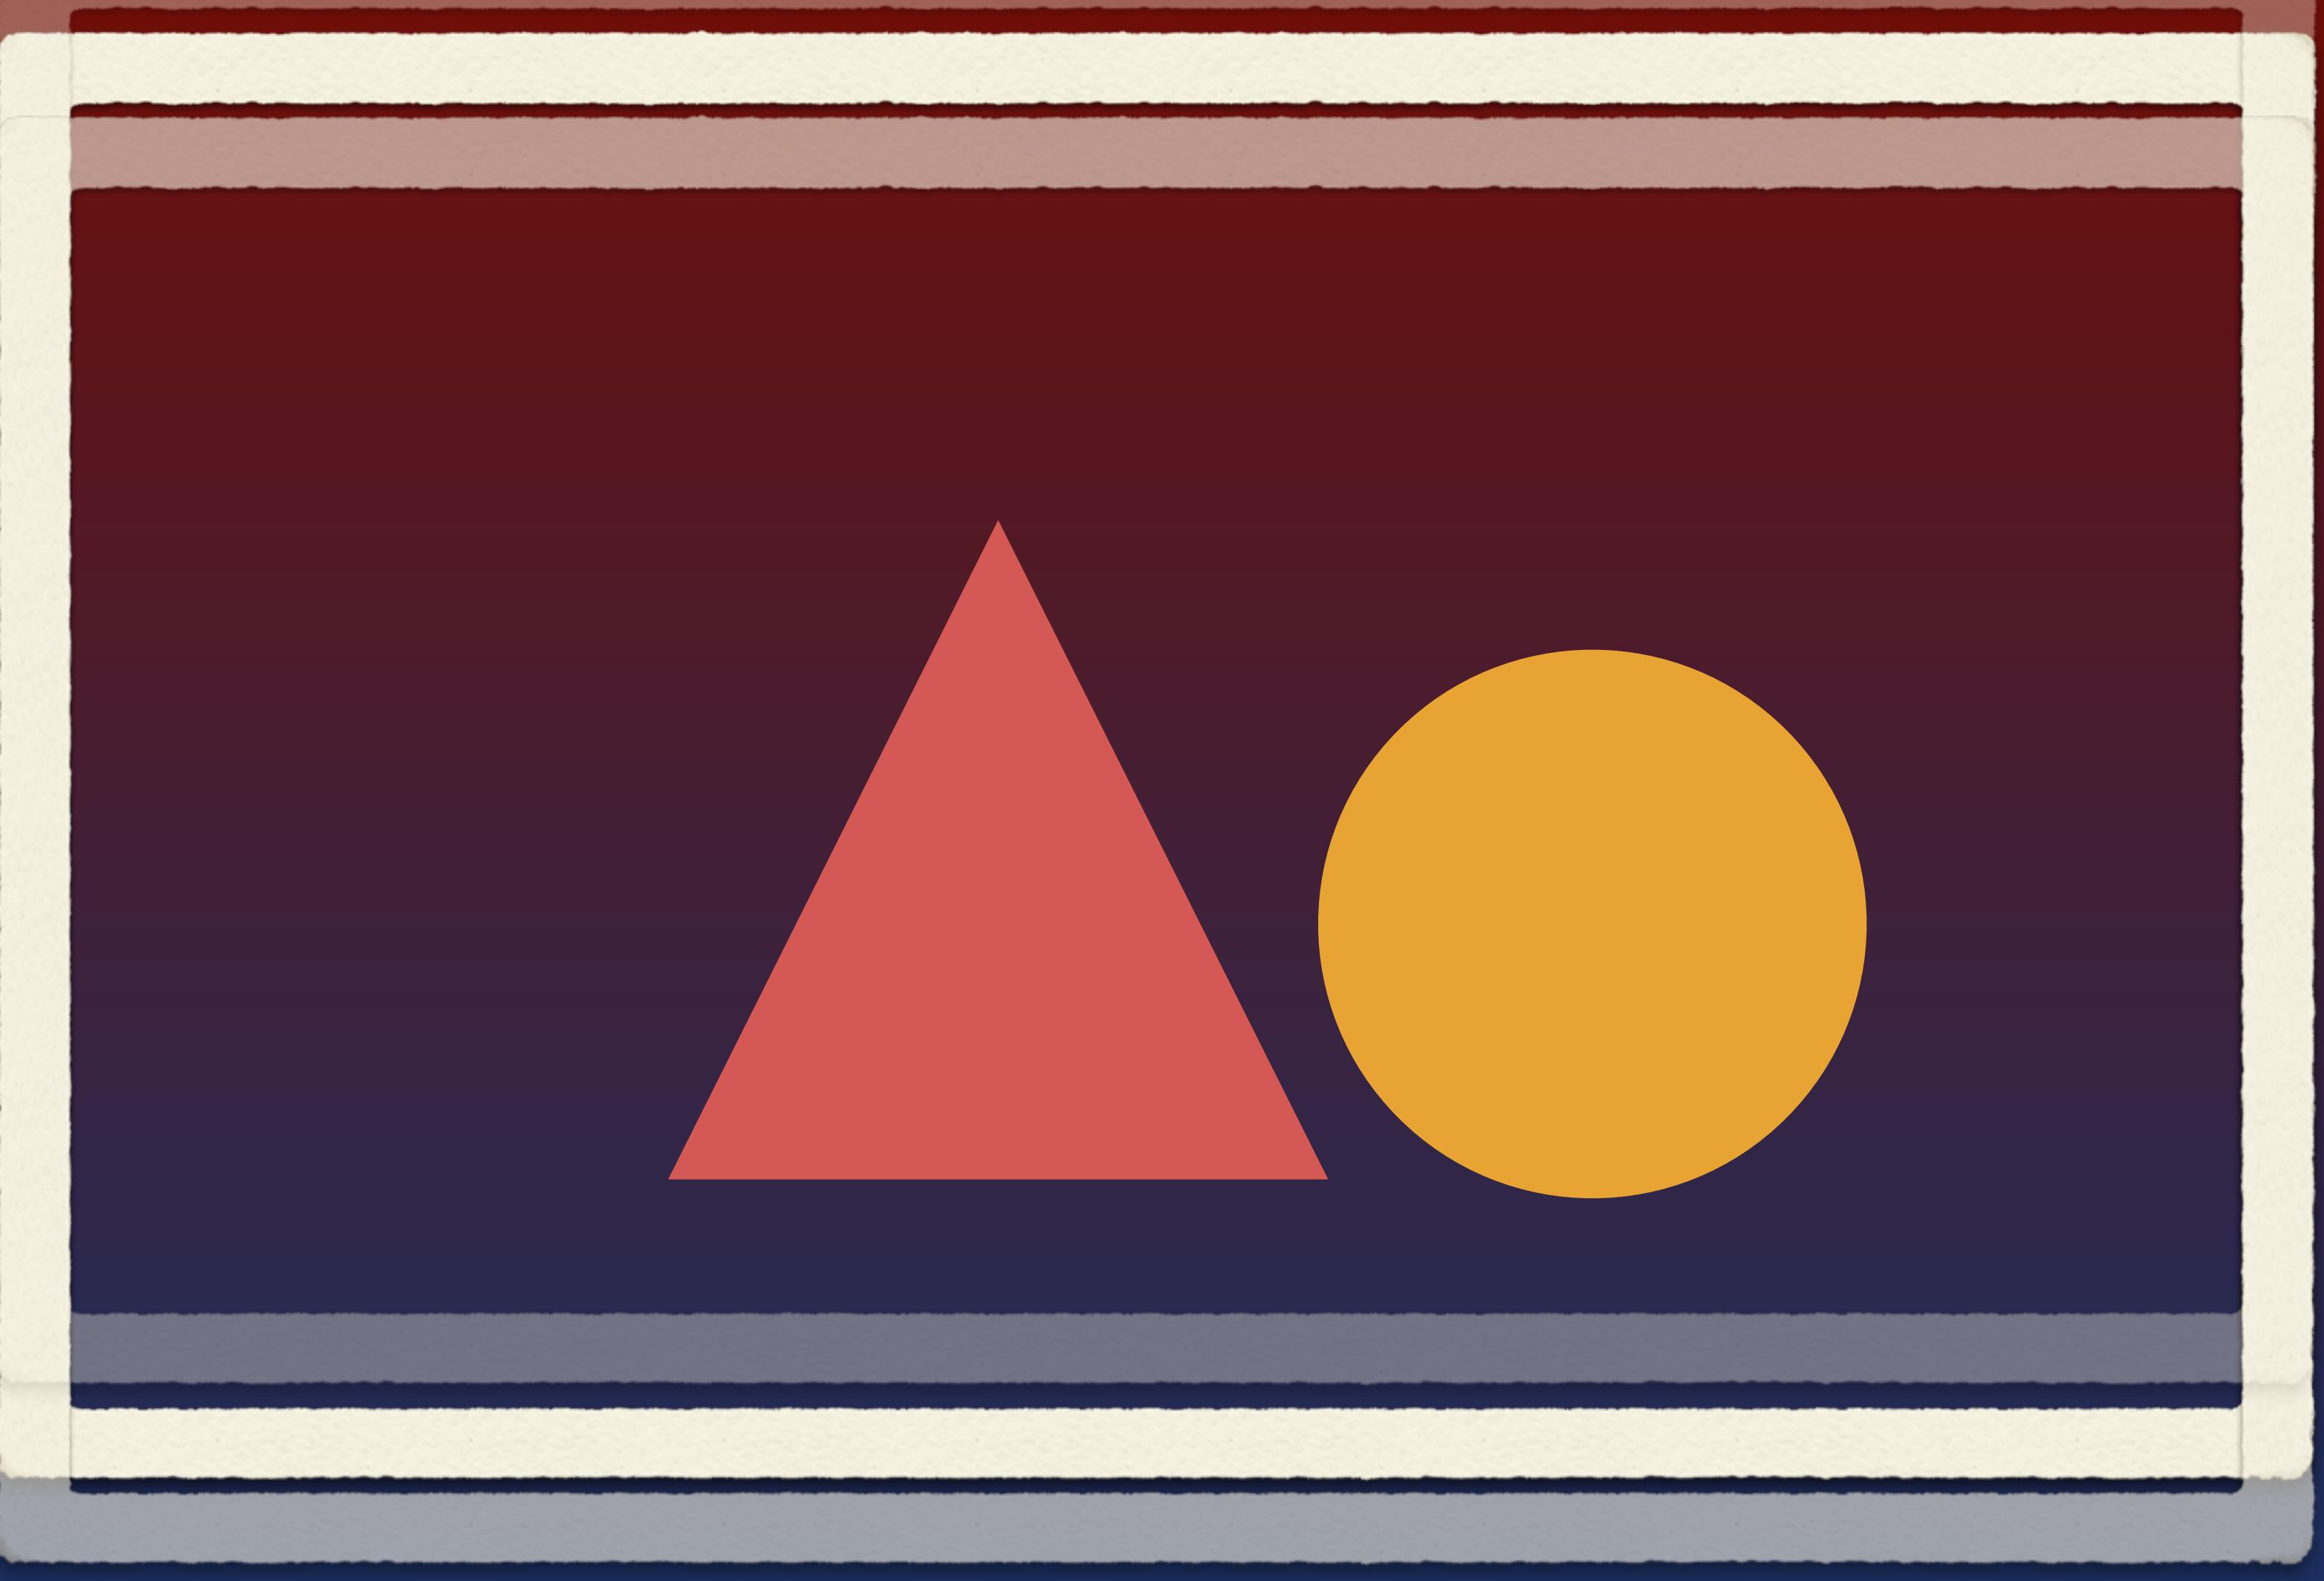

Screen Shake!

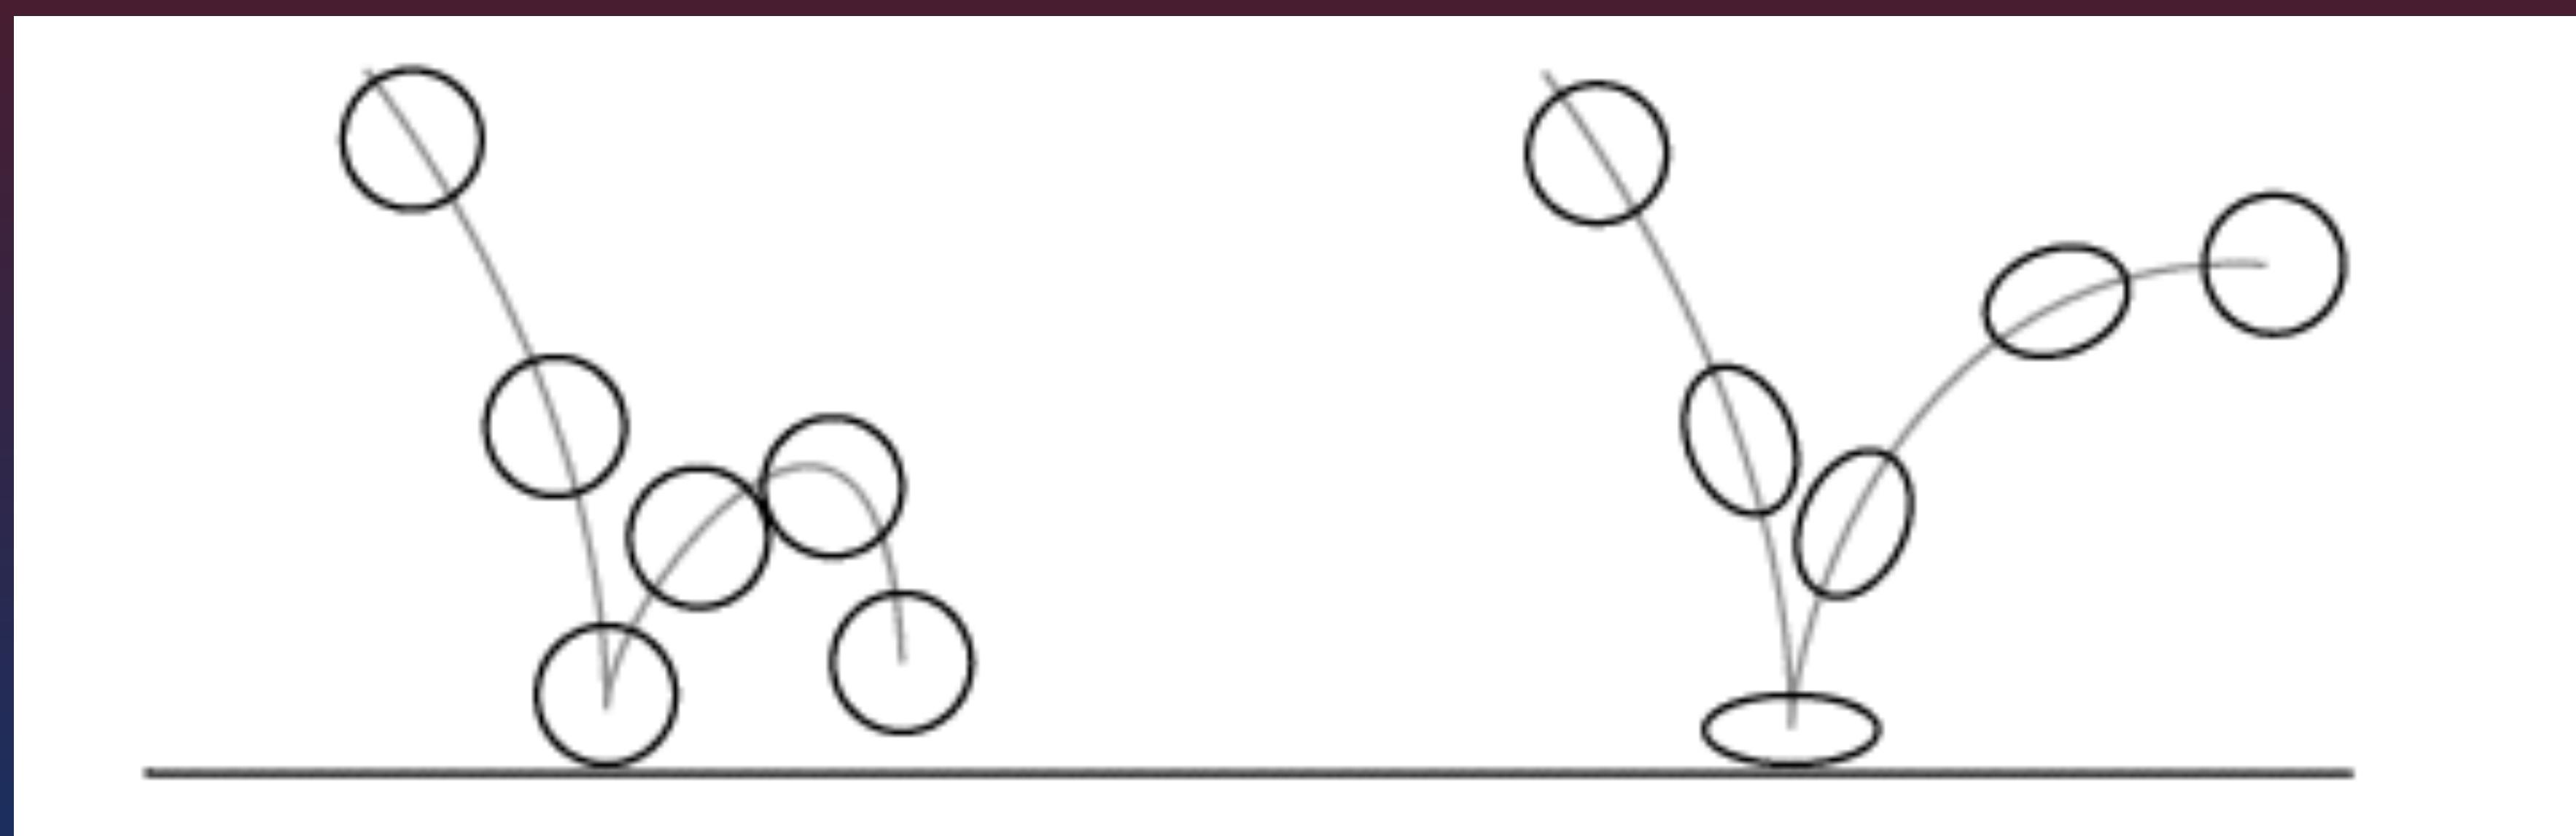

```
screenShakeValue += elapsed;  
  
glTranslatef(0.0f, sin(screenShakeValue * screenShakeSpeed)* screenShakeIntensity, 0.0f);
```

You can shake it sideways or both ways!

THERE IS NO WRONG WAY TO SHAKE THE SCREEN.

Squash and stretch.

Stretching.

Squashing.

Fast movement on the X axis or
impact on the Y axis..

Fast movement on the Y axis or
impact on the X axis..

Thomas was Alone.

https://www.youtube.com/watch?v=22WW4_BxpR8#t=467

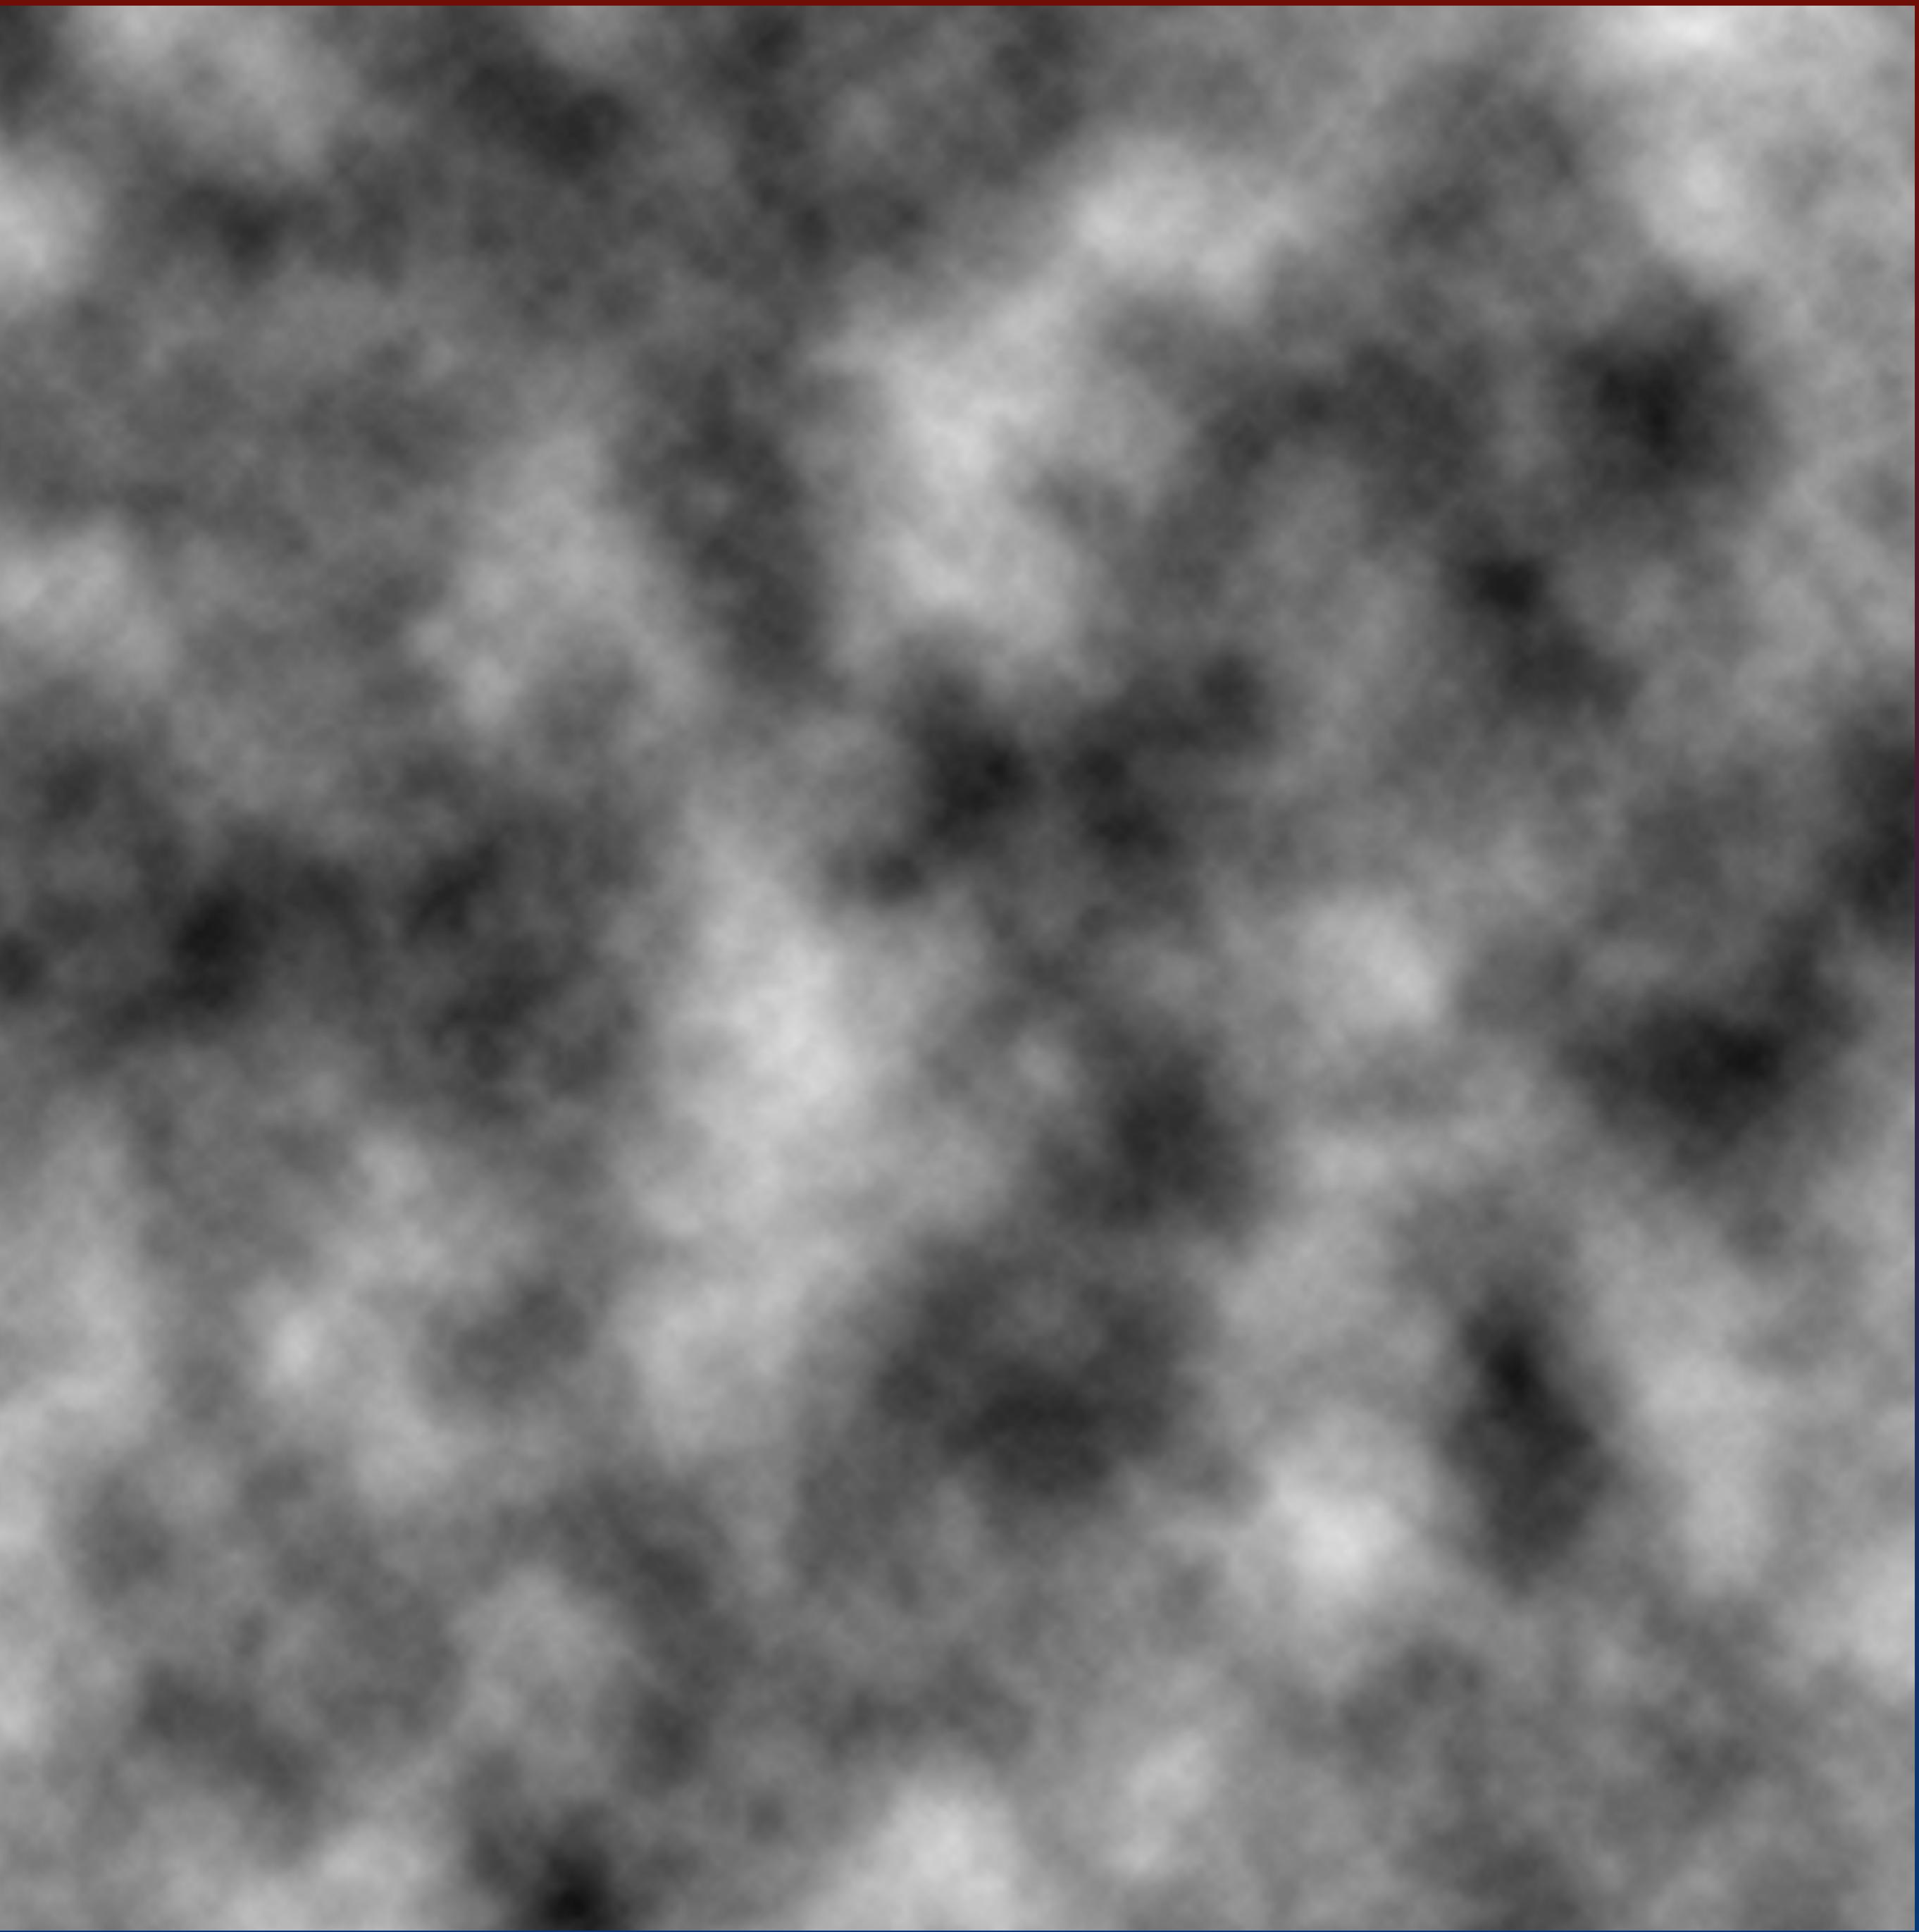

Map velocity on an axis to scale on that axis and inverse of that scale on the other axis.

Map velocity on an axis to scale on that axis and inverse of that scale on the other axis.

```
// map Y velocity 0.0 - 5.0 to 1.0 - 1.6 Y scale and 1.0 - 0.8 X scale  
scale_y = mapValue(fabs(velocity_y), 0.0, 5.0, 1.0, 1.6);  
scale_x = mapValue(fabs(velocity_y), 5.0, 0.0, 0.8, 1.0);
```

Perlin noise.

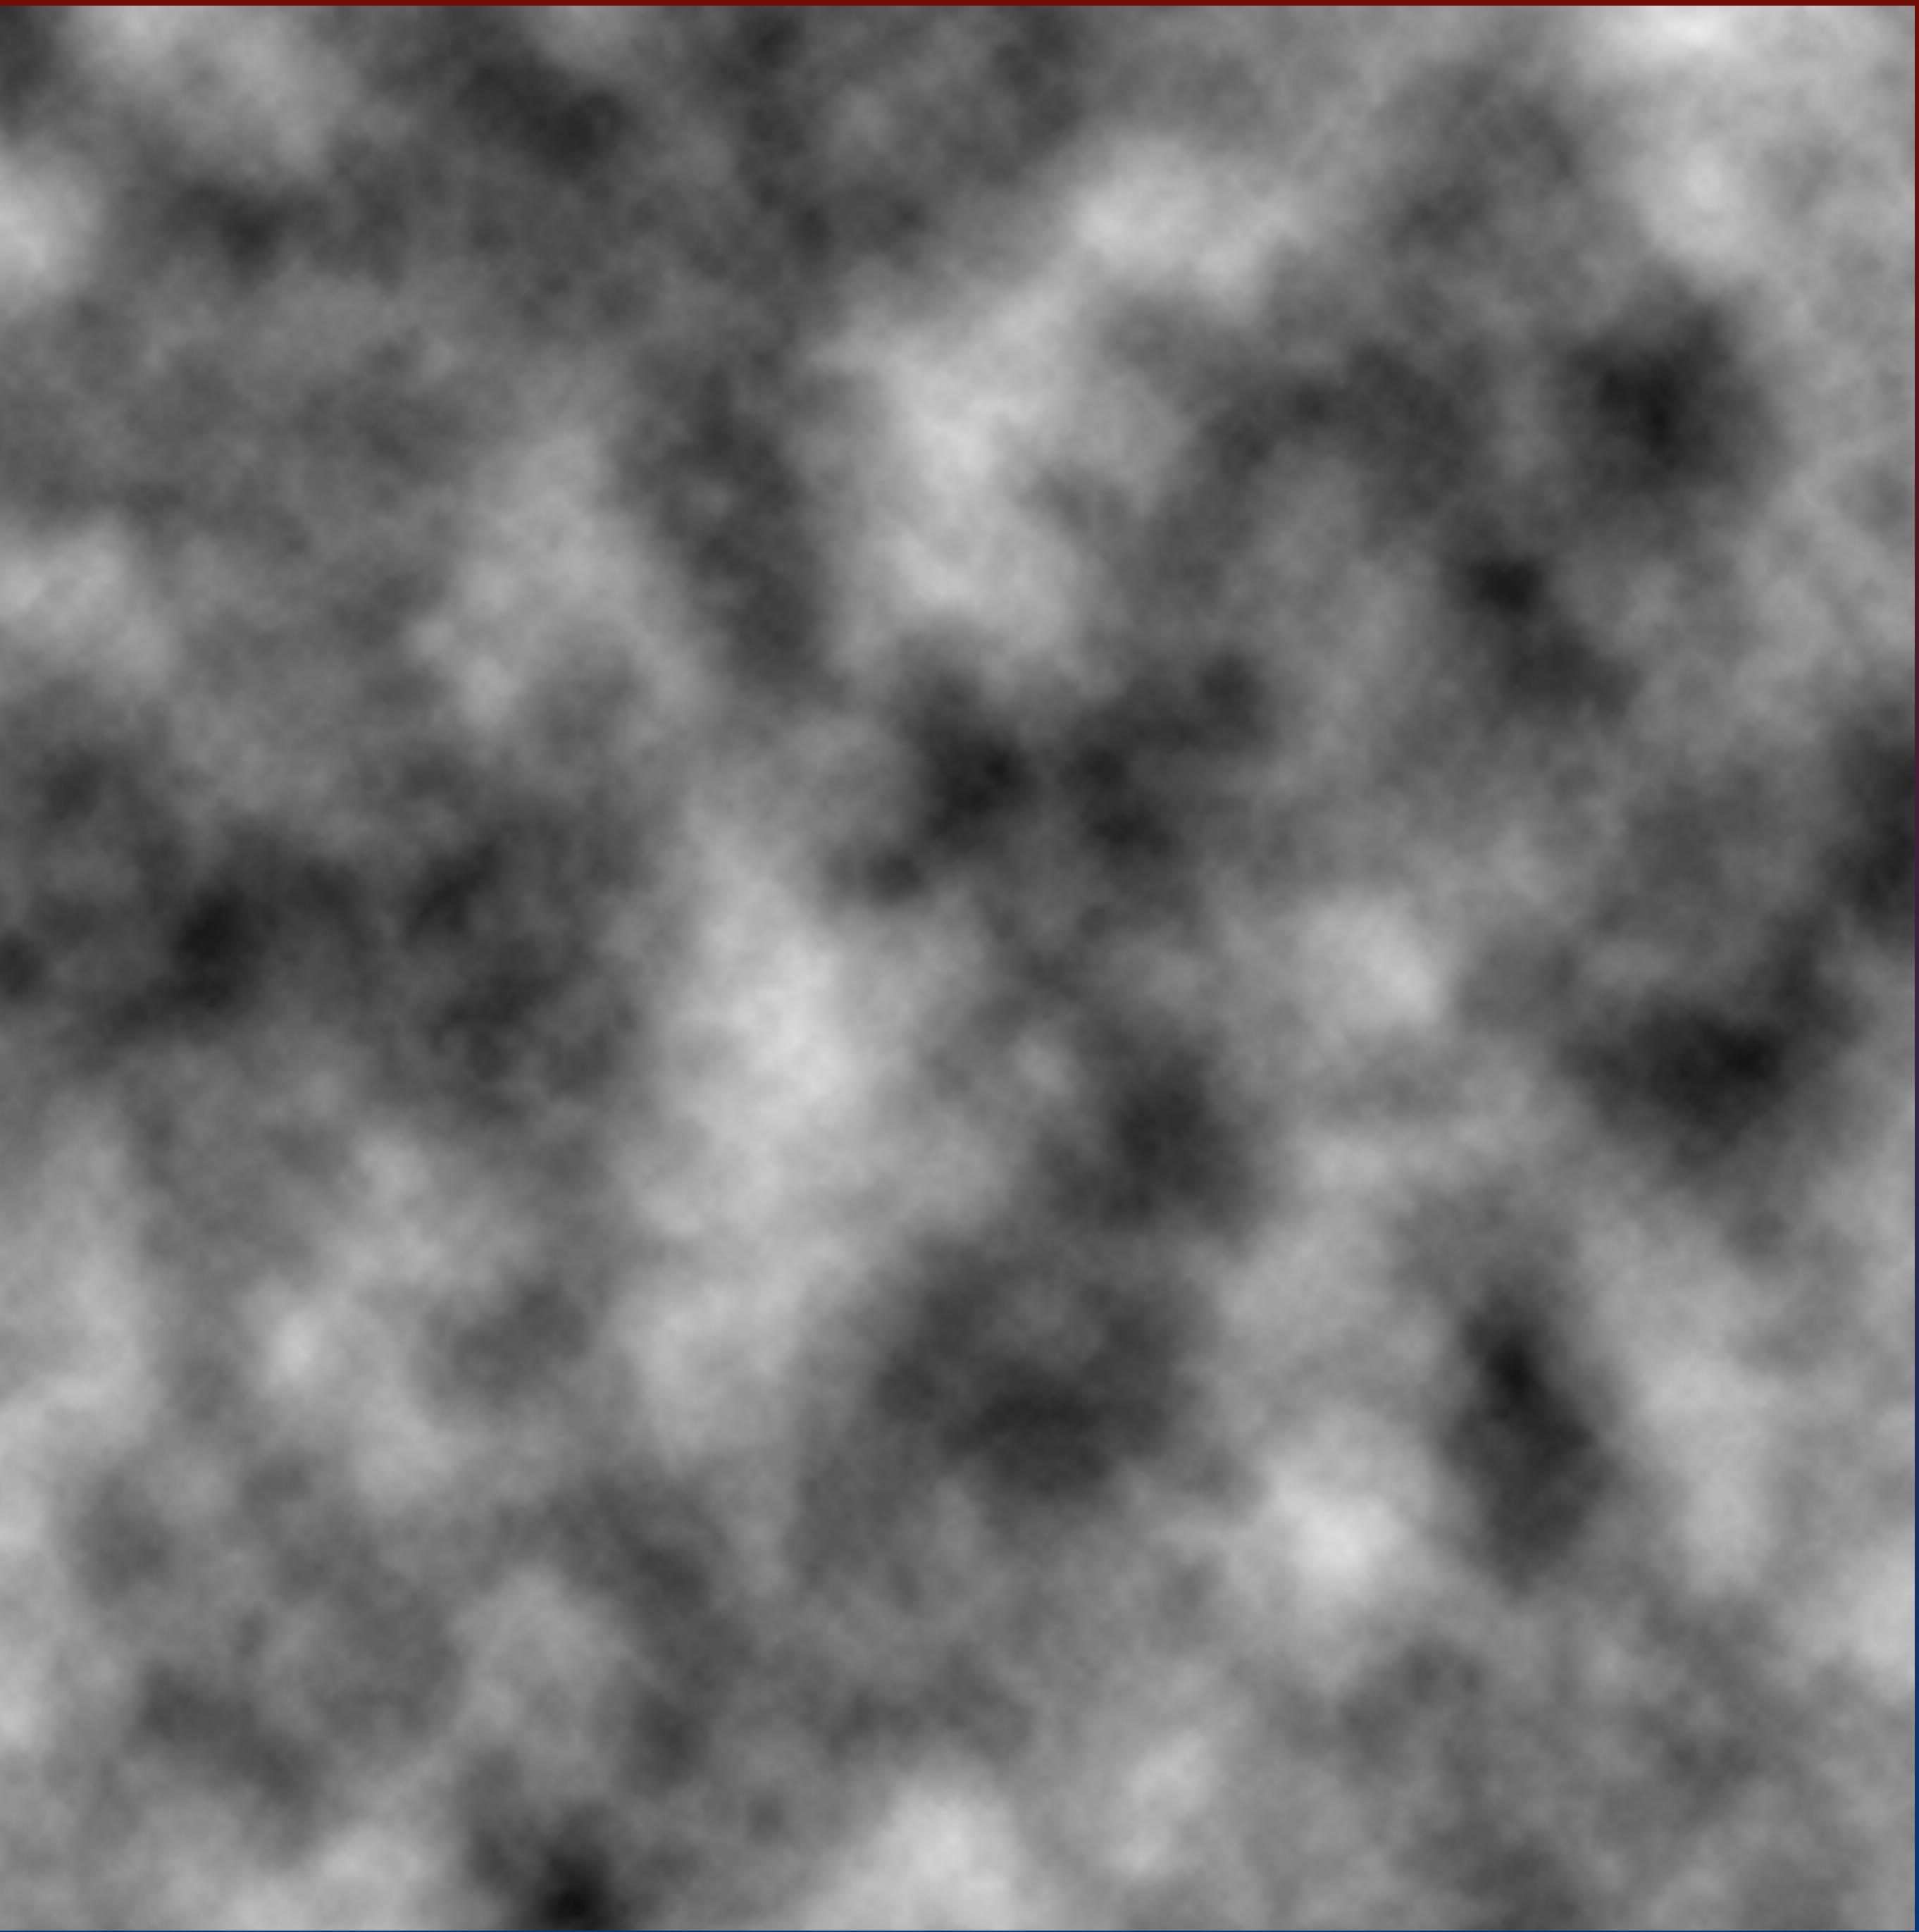

<http://mrl.nyu.edu/~perlin/doc/oscar.html>

Use PerlinNoise.h and PerlinNoise.cpp
in class repository.

noise2 returns a -1.0 to 1.0 noise value
for a 2D coordinate.

```
float coord[2] = {0.05f, 0.0};  
float val = noise2(coord);
```

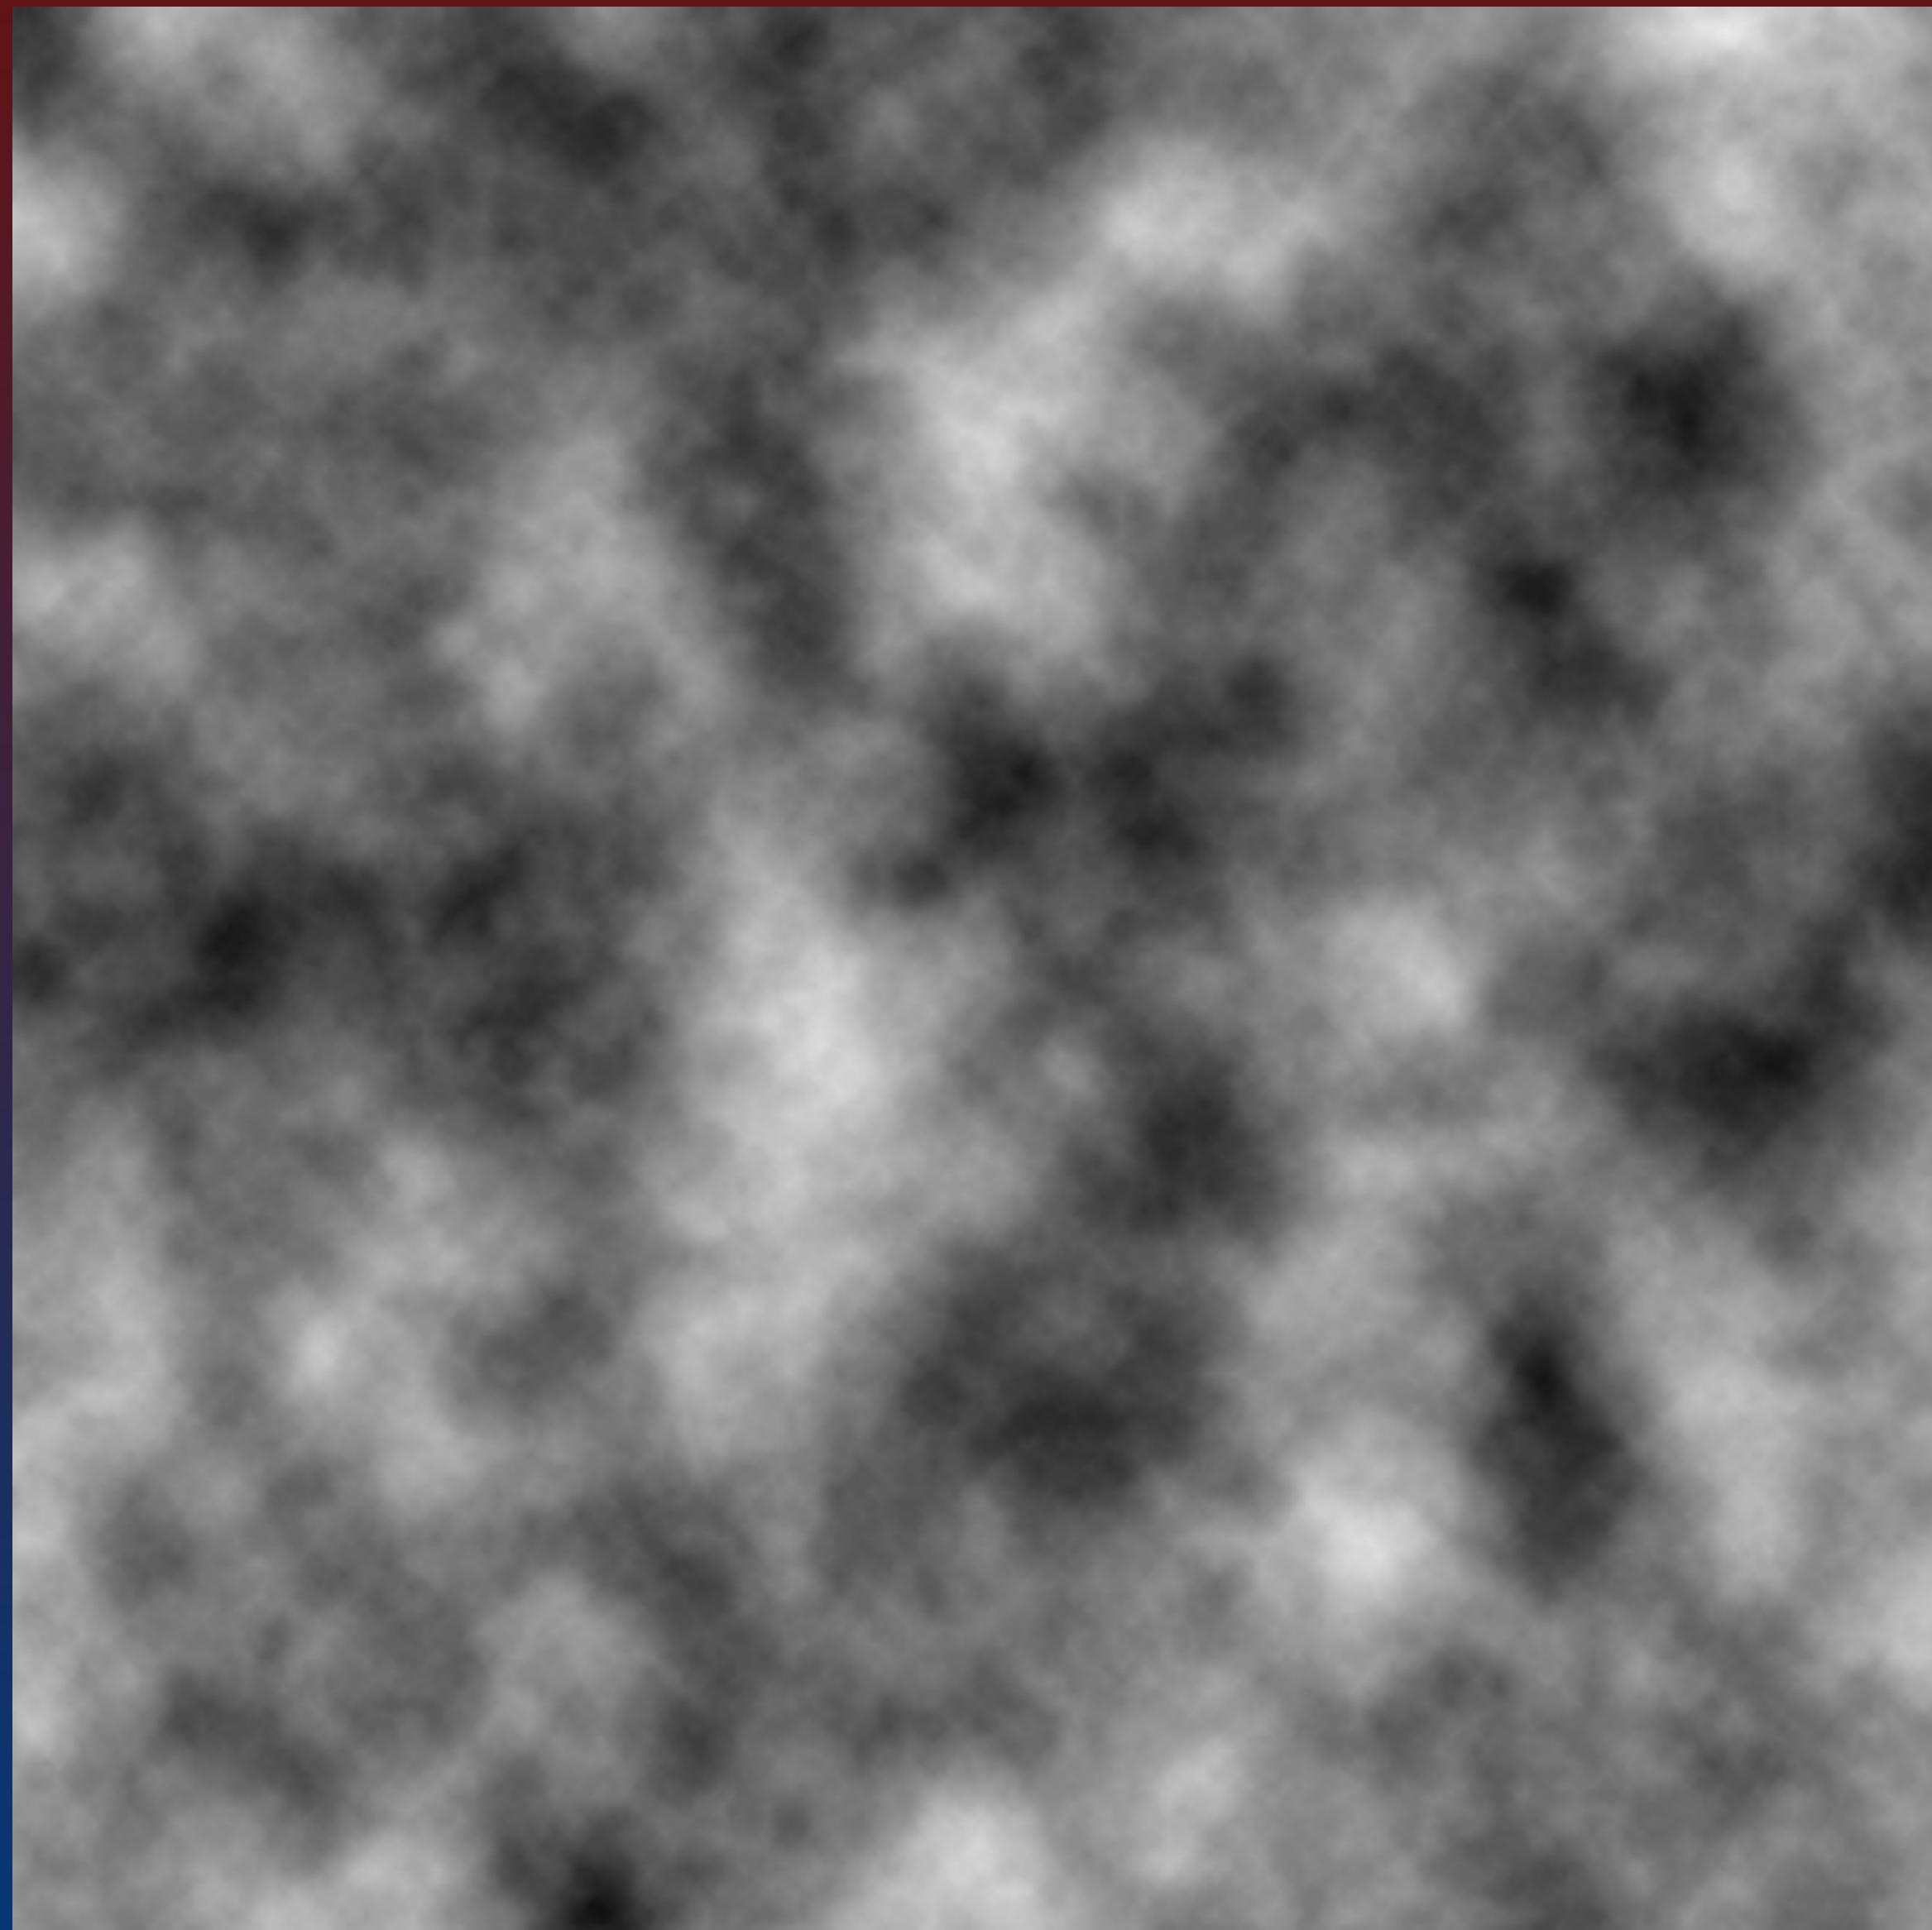

noise1 returns a -1.0 to 1.0 noise value
for a 1D coordinate.

```
float val = noise1(0.5f);
```

Using perlin noise for natural movement.

Time elapsed

Shaky cam example using 1D noise.

```
perlinValue += elapsed;  
glTranslatef(noise1(perlinValue), noise1(perlinValue+ 10.0f), 0.0);
```

Shaky cam example using 2D noise.

```
perlinValue += elapsed;  
  
float coord[2] = {perlinValue, 0.0};  
float val = noise2(coord);  
  
coord[1] = 0.5f;  
float val2 = noise2(coord);  
glTranslatef(val, val2, 0.0);
```

You can use Perlin noise for good looking screen shake too!

Or to make things hover
realistically.

Fading in and out.

To fade the screen, you can draw a black rectangle on top of your scene using vertex colors and animate the vertex color alpha.

Don't forget to enable blending!
